About

- Author of:

- Introduced Linux Trace Toolkit in 1999
- Originated Adeos and relayfs (kernel/relay.c)
- Training, Custom Dev, Consulting, ...

About Android

- Huge
- Fast moving
- Stealthy

About Android

- Huge
- Fast moving
- Stealthy

Mainly:

- Internals-specifics are subject to change

Therefore:

- Must learn to relearn every new release

Goals

- Master the intricacies of all components making up Android, including kernel Androidisms
- Get hands-on experience in building and customizing Android-based embedded systems
- Learn basics of Android app development
- Familiarize with the Android ecosystem

Format

- Tracks:
 - Lecture
 - Exercises
- Fast pace
- Lots of material

Requirements

- Embedded systems development
- C, C++
- Basic Unix/Linux command line interface experience
- Java (working knowledge of) and/or fast learner ;)

Knowledge Fields

- Main fields:
 - Embedded systems
 - Linux kernel internals
 - Device driver development
 - Unix system administration
 - GNU software development
 - Java-based development
 - Android app development
- Vastly different fields, few (if any) master all
- Fluency required to tackle tough problems

Topics

- Setting context:
 - Introduction to embedded Android
 - Concepts and internals
 - Android Open Source Project (AOSP)
 - Kernel basics
- Android Essentials:
 - Embedded Linux root FS
 - Native Android user-space
 - System Server
 - Hardware Abstraction Layer
 - Android Framework

- Running Code in Android
- Hacks, Variants, Tricks and Resources
- Hardware porting and support:
 - Manipulating solid-state storage devices
 - Choosing and installing the root filesystem
 - Kernel internals
 - Device driver development overview
- Additional material:
 - A quick Java introduction

- Niche topics:
 - 3rd party projects, resources and tools
 - Compatibility Test Suite

Courseware

- These slides
- Exercises
- Android documentation:
 - source.android.com
 - developer.android.com
 - tools.android.com
- Android Open Source Project:

'Use the Source, Luke, use the Source. Be one with the code.' -- Linus Torvalds

Hands-On Environment

- Host:
 - Ubuntu 64-bit 10.04 or 10.10
 - 10GB / AOSP (source is 4GB / AOSP)
- BeagleBone:
 - TI AM3359 (OMAP 3 / ARM Cortex A8)
 - 720MHz (when DC powered)
 - 256MB RAM
 - Boots off microSD
 - Single-cable USB/Serial/JTAG
- QEMU:
 - Same emulator used for App development
 - Originally at: www.qemu.org
 - Shipped with AOSP
 - Expandable (can create new “hardware” via .so files)
 - Has been around for a long time

Introduction to Embedded Android

- Basics
- History
- Ecosystem
- Legal framework
- Platform and hardware requirements
- Development tools

1. Basics

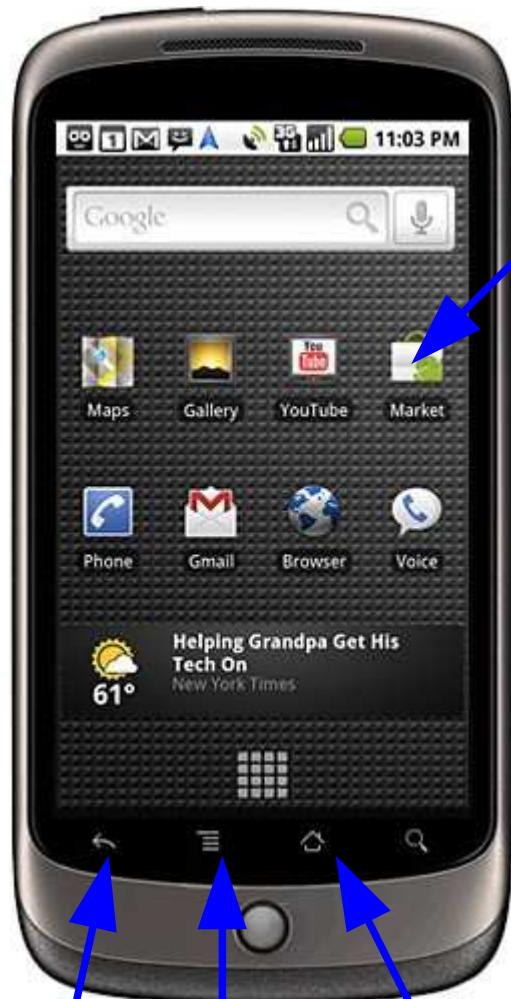

- Features
- UX Concepts
- App Concepts

1.1. Features

- Application framework enabling reuse and replacement of components
- Dalvik virtual machine optimized for mobile devices
- Integrated browser based on the open source WebKit engine
- Optimized graphics powered by a custom 2D graphics library; 3D graphics based on the OpenGL ES 1.0 specification (hardware acceleration optional)
- SQLite for structured data storage
- Media support for common audio, video, and still image formats (MPEG4, H.264, MP3, AAC, AMR, JPG, PNG, GIF)
- GSM Telephony (hardware dependent)
- Bluetooth, EDGE, 3G, and WiFi (hardware dependent)
- Camera, GPS, compass, and accelerometer (hardware dependent)
- Rich development environment including a device emulator, tools for debugging, memory and performance profiling, and a plugin for the Eclipse IDE

1.2. UX Concepts

- Browser-like
- iPhone-ish
- No user-concept of “task”
- Main keys:
 - HOME
 - SEARCH
 - BACK
 - MENU
- App-model allows users to safely install/test almost anything

Activity

“Click” →

Activity #1

“Back” ↑

↓ **“Click”**

Home

Back

1.3. App Concepts

- No single entry point (No main() !?!?)
- Unlike Windows or Unix API/semantics in many ways
- Processes and apps will be killed at random: developer must code accordingly
- UI disintermediated from app “brains”
- Apps are isolated, very
- Behavior predicated on low-memory conditions

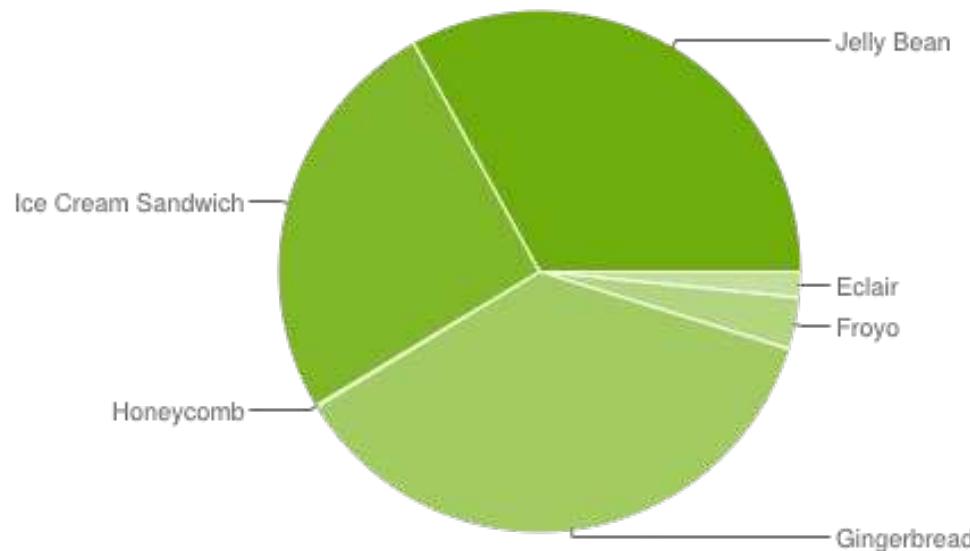

2. History

- 2002:
 - Sergey Brin and Larry Page started using Sidekick smartphone
 - Sidekick one of 1st smartphones integrating web, IM, mail, etc.
 - Sidekick was made by Danger inc., co-founded by Andy Rubin (CEO)
 - Brin/Page met Rubin at Stanford talk he gave on Sidekick's development
 - Google was default search engine on Sidekick
- 2004:
 - Despite cult following, Sidekick wasn't making \$
 - Danger inc. board decided to replace Rubin
 - Rubin left. Got seed \$. Started Android inc. Started looking for VCs.
 - Goal: Open mobile hand-set platform
- 2005 - July:
 - Got bought by Google for undisclosed sum :)
- 2007 - November:
 - Open Handset Alliance announced along with Android

- 2008 - Sept.: Android 1.0 is released
- 2009 - Feb.: Android 1.1
- 2009 - Apr.: Android 1.5 / Cupcake
- 2009 - Sept.: Android 1.6 / Donut
- 2009 - Oct.: Android 2.0/2.1 / Eclair
- 2010 - May: Android 2.2 / Froyo
- 2010 - Dec.: Android 2.3 / Gingerbread
- 2011 - Jan : Android 3.0 / Honeycomb – Tablet-optimized
- 2011 – May: Android 3.1 – USB host support
- 2011 – Nov: Android 4.0 / Ice-Cream Sandwich – merge Gingerbread and Honeycomb
- 2012 – Jun: Android 4.1 / Jelly Bean – Platform Optimization
- 2012 – Nov: Android 4.2 / Jelly Bean - Multi-user support

3. Ecosystem

- 1.5M phone activations per day
- 850k apps (vs. 850k for Apple's app store)
- 75% global smartphone marketshare (iOS is 17%)

3.1. Who's playing?

- Leading IP:
 - Google
 - Semiconductor manufacturers:
 - ARM, Intel, Freescale, TI, Qualcomm, NVIDIA, ...
 - Handset manufacturers:
 - Motorola, Samsung, HTC, LG, Sony Ericsson, ...
 - Tablet manufacturers:
 - Motorola, Samsung, Archos, DELL, ASUS, ...
 - Special-purpose devices:
 - Nook, Joint Battle Command-Platform, ...
 - App stores:
 - Android Market, Amazon App Store, V CAST Apps, B&N NOOK Apps, ...
-

3.2. Open Handset Alliance

- "... a group of 80 technology and mobile companies who have come together to accelerate innovation in mobile and offer consumers a richer, less expensive, and better mobile experience. Together we have developed Android™, the first complete, open, and free mobile platform."
- Unclear what OHA does or what benefits, if any, members derive
- Not an organization with board members, staff, etc. ... just an "Alliance"
- Google's Android team are the lead on all bleeding edge dev, all else tag along
- OHA is largely inactive / absent
- Comprised of:
 - Mobile Operators: Sprint, T-Mobile, Vodafone, NTT Docomo, ...
 - Handset Manufacturers: HTC, Motorola, LG, Samsung, Sony Ericsson, ...
 - Semiconductor Companies: ARM, Freescale, Intel, NVIDIA, Qualcomm, TI, ...
 - Software Companies: Google, ...
 - Commercialization Companies: ...

4. Legal Framework

- Code access
- Code licenses
- Branding use
- Google's own Android Apps
- Alternative App stores
- Oracle v. Google

4.1. Code Access

- Parts:
 - Kernel
 - Android Open Source Project (AOSP)
- Kernel:
 - Should have access to latest shipped version => GPL requirement
 - Google-maintained forks at android.googlesource.com
- AOSP:
 - *Usually* Code-drops every 6 months
 - Official AOSP branches at android.googlesource.com
 - Managed by “repo” tool, an overlay to “git”
- Honeycomb (3.0) code required talking to Google
 - ... which hasn't precluded moders from lifting binaries off the SDK and putting Honeycomb on all sorts of devices, including B&N's Nook ...

4.2. Code Licenses

- Kernel:
 - GNU General Public License (a.k.a. GPL)
- AOSP:
 - Mostly Apache License 2.0 (a.k.a. ASL)
 - Having GPL-free user-space was a design goal
 - A few GPL and LGPL parts: mainly BlueZ and DBUS
 - Some key components in BSD: Bionic and Toolbox
 - “external/” directory contains a mixed bag of licenses, incl. lots of GPL
- May be desirable to add GPL/LGPL components:
 - BusyBox
 - uClibc / eglibc / glibc

4.3. Branding Use

- Android Robot:
 - Very much like the Linux penguin
- Android Logo (A-N-D-R-O-I-D w/ typeface):
 - Cannot be used
- Android Custom Typeface:
 - Cannot be used
- Android in Official Names:
 - As descriptor only: “for Android”
 - Most other uses require approval
- Android in Messaging:
 - Allowed if followed by a generic: “Android Application”
- Compliance through CDD/CTS involved in “approval”

4.4. Google's own Android Apps

- The non-AOSP apps:
 - Android Market
 - YouTube
 - Maps and Navigation
 - Gmail
 - Voice
 - SkyMap
 - ...
- Require:
 - CTS/CDD Compliance
 - Signed agreement w/ Google
- Inquiries: android-partnerships@google.com

4.5. Alternative “App Stores”

- A couple of stores are already public:
 - Android Market
 - Amazon App Store
 - V CAST Apps
 - B&N NOOK Apps
 - ...
- Nothing precluding you from having your own

4.6. Oracle v. Google

- Filed August 2010
- Patent infringement:
 - 6,125,447; 6,192,476; 5,966,702; 7,426,720; RE38,104; 6,910,205; and 6,061,520
- Copyright infringement:
- Android does not use any Oracle Java libraries or JVM in the final product.
- Android relies on Apache Harmony and Dalvik instead.
- In October 2010, IBM left Apache Harmony to join work on Oracle's OpenJDK, leaving the project practically orphaned.
- In May 2011, judge orders claims cut from 132 to 3 and prior art references cut from hundreds to 8

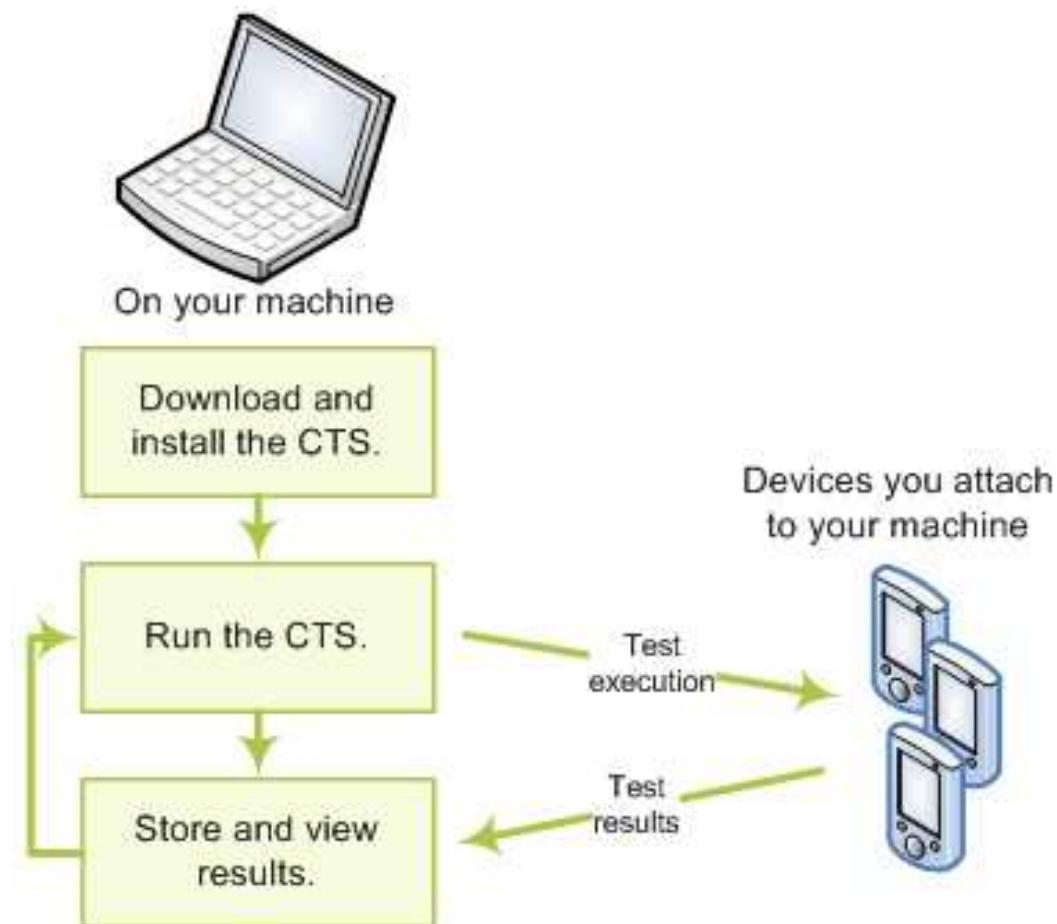

5. Platform and Hardware requirements

- In principle:
 - Android runs on top of Linux
 - Therefore: if it runs Linux, it can run Android
- Known to have been made to work on:
 - ARM
 - x86
 - MIPS
 - SuperH
- Put in all sort of devices:
 - Washers, micro-wave ovens, car systems, etc.

5.1. Compliance Definition Document

- Software: MUST conform to AOSP
- Application Packaging Compatibility: support “.apk” files
- Multimedia Compatibility: decoders, encoders, recording, ...
- Developer Tool Compatibility: adb, ddms, Monkey
- Hardware compatibility:
 - Display and Graphics
 - Input Devices
 - Data Connectivity
 - Cameras
 - Memory and Storage
 - USB
- Performance Compatibility
- Security Model Compatibility
- Software Compatibility Testing
- Updatable Software: MUST include mechanism to update

5.2. Compatibility Test Suite

6. Development tools

- Requirements
- App dev tools and resources
- App debugging

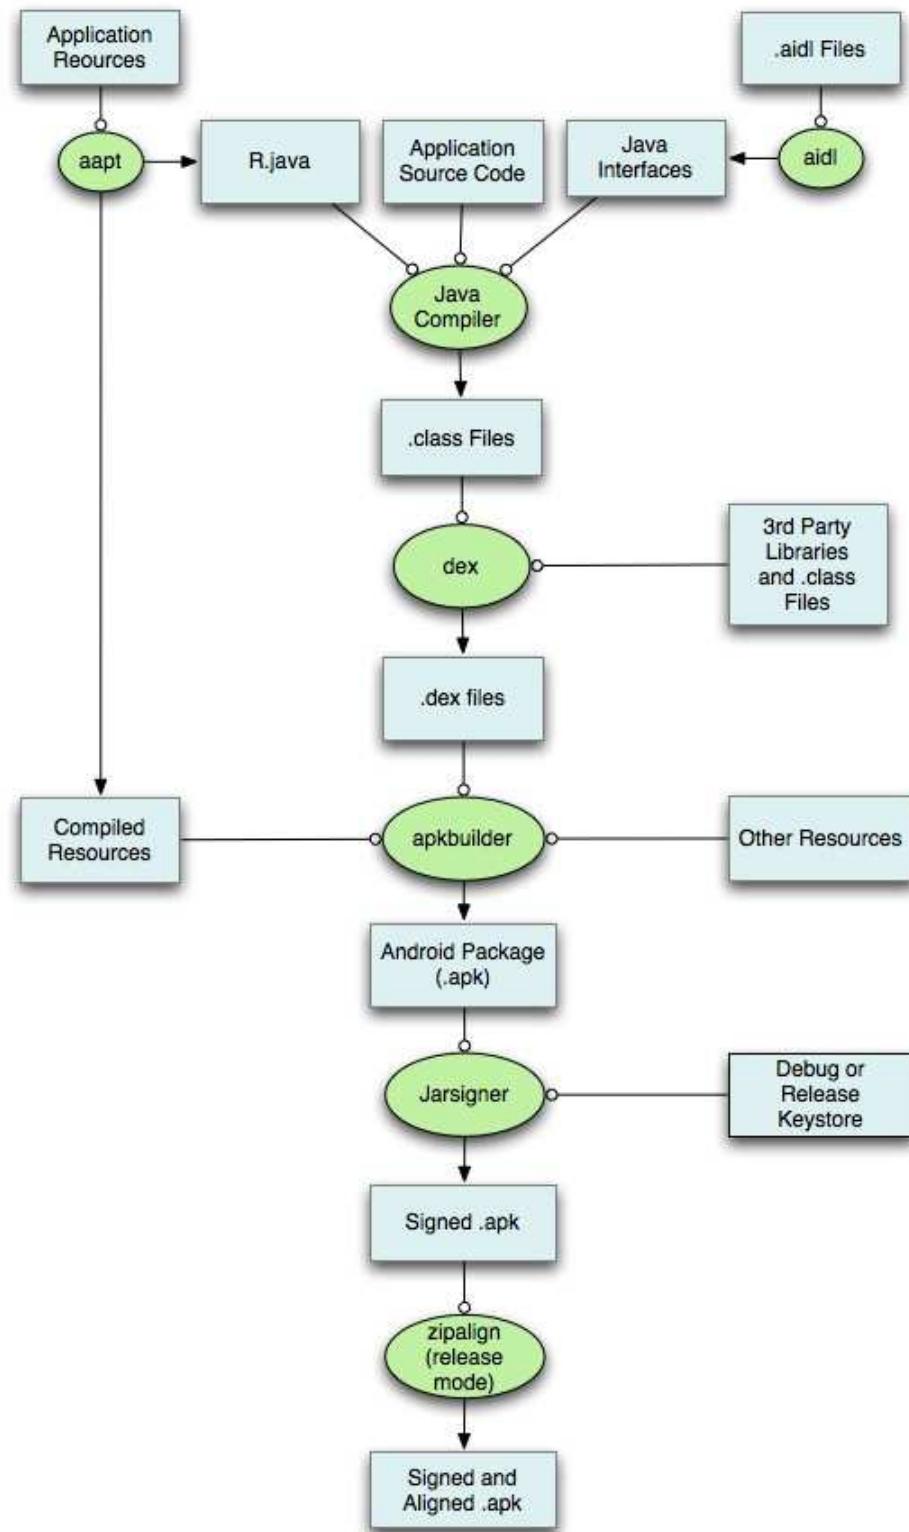

6.1. Requirements

- App development and debugging:
 - Windows / Mac / Linux workstation
 - JDK
 - Eclipse w/ ADT plugin
 - Highly recommended: real device(S)
- Platform development:
 - GNU cross-dev toolchain
 - JTAG debugger
 - ... more on this later

6.2. App dev tools and resources

- SDK:
 - android – manage AVDs and SDK components
 - apkbuilder – creating .apk packages
 - dx – converting .jar to .dex
 - adb – debug bridge
 - ...
- Emulator – QEMU-based ARM emulator
 - Use KVM for x86 instead
- NDK: GNU toolchain for native binaries
- Documentation: developer.android.com

6.3. App debugging

- adb
- ddms
- monkeyrunner
- traceview
- logcat
- Eclipse integration (ADT plugin)

Concepts and Internals

- 1. Android Concepts
- 2. Framework Intro
- 3. Overall Architecture
- 4. System startup
- 5. Linux Kernel
- 6. Hardware Support
- 7. Native User-Space
- 8. Dalvik
- 9. JNI
- 10. System Server
- 11. Calling on Services
- 12. Activity Manager
- 13. Binder
- 14. HAL
- 15. Stock AOSP Apps

1. Android Concepts

- Components
- Intents
- Component lifecycle
- Manifest file
- Processes and threads
- Remote procedure calls

1.1. Components

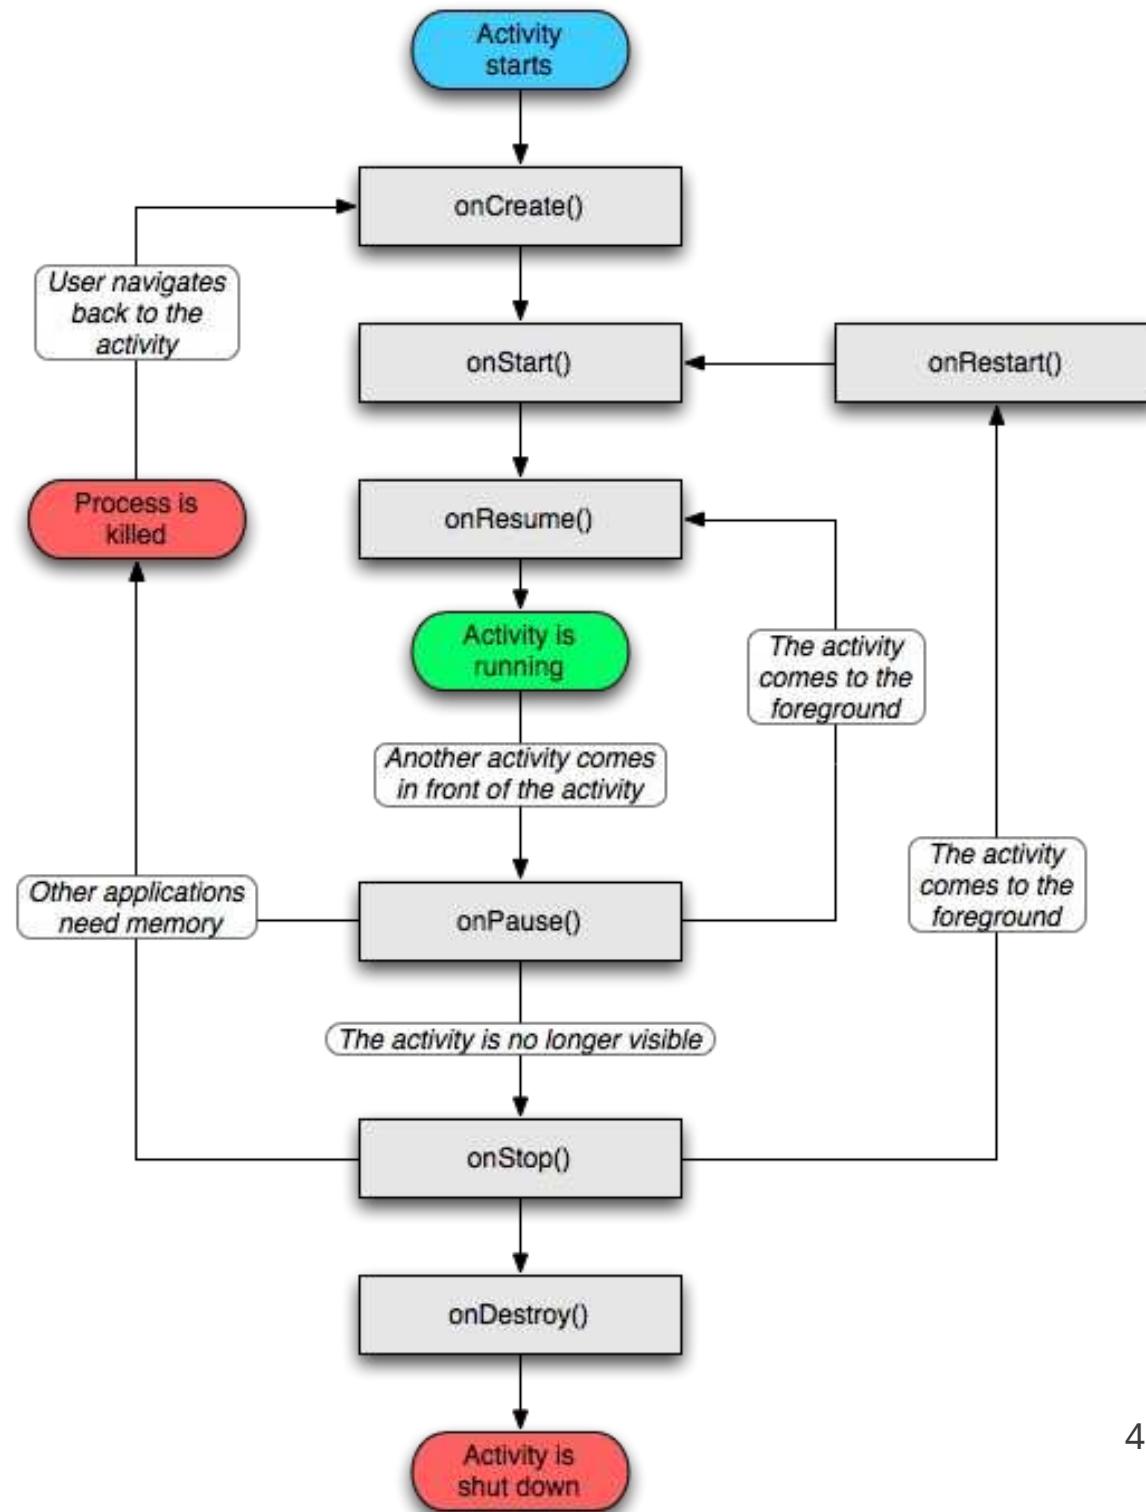

- 1 App = N Components
- Apps can use components of other applications
- App processes are automagically started whenever any part is needed
- Ergo: N entry points, !1, and !main()
- Components:
 - Activities
 - Services
 - Broadcast Receivers
 - Content Providers

1.2. Intents

- Intent = asynchronous message w/ or w/o designated target
- Like a polymorphic Unix signal, but w/o required target
- Intents “payload” held in Intent Object
- Intent Filters specified in Manifest file

1.3. Component lifecycle

- System automagically starts/stops/kills processes:
 - Entire system behaviour predicated on low memory
- System triggers Lifecycle callbacks when relevant
- Ergo: Must manage Component Lifecycle
- Some Components are more complex to manage than others

1.4. Manifest file

- Informs system about app's components
- XML format
- Always called AndroidManifest.xml
- Components
 - Activity = <activity> ... static
 - Service = <service> ... static
 - Broadcast Receiver:
 - Static = <receiver>
 - Dynamic = Context.registerReceiver()
 - Content Provider = <provider> ... static
- Intent filters

1.5. Processes and threads

- Processes
 - Default: all callbacks to any app Component are issued to the main process thread
 - <activity>—<service>—<recipient>—<provider> have process attribute to override default
 - Do NOT perform blocking/long operations in main process thread:
 - Spawn threads instead
 - Process termination/restart is at system's discretion
 - Therefore:
 - Must manage Component Lifecycle
- Threads:
 - Create using the regular Java Thread Object
 - Android API provides thread helper classes:
 - Looper: for running a message loop with a thread
 - Handler: for processing messages
 - HandlerThread: for setting up a thread with a message loop

1.6. Remote procedure calls

- Android RPCs = Binder mechanism
- No Sys V IPC due to in-kernel resource leakage
- Binder is a low-level functionality, not used as-is
- Instead: must define interface using Interface Definition Language (IDL)
- IDL fed to aidl Tool to generate Java interface definitions

2. Framework Introduction

- UI
- Data storage
- Security/Permissions
- ... and much more ... :
 - Graphics
 - Audio and Video
 - Location and Maps
 - Bluetooth
 - NFC

2.1. UI

- Everything based on hierarchy of Views and ViewGroups (layouts)
- Declared in XML or dynamically through Java
- UI components:
 - Widgets
 - Event handlers
 - Menus
 - Dialogs
 - Notifications
 - ...

2.2. Data storage

- Shared preferences
 - Private primitive key-pair values
- Internal storage
 - Private data on device memory
- External storage
 - Public data on shared external device (SD)
- SQLite DB
 - Private DB
- Network connection
 - Web-based storage (REST)

2.3. Security/Permissions

- Most security enforced at process level: UID, GID
- Permissions enforce restrictions on:
 - Per-process operations
 - Per-URI access
- Applications are sandboxed
- Specific permissions required to “exit” sandbox
- Decision to grant access based on:
 - Certificates
 - User prompts
- All permissions must be declared statically

2.4. Native development

- Useful for:
 - Porting existing body of code to Android
 - Developing optimized native apps, especially for gaming
- Provides:
 - Tools and build files to generate native code libraries from C/C++
 - Way to embed native libs into .apk
 - Set of stable (forward-compatible) native libs
 - Documentation, samples and tutorials
- Enables:
 - Calling native code from Java using JNI
 - Implementing fully native apps (since 2.3)
- Doesn't allow you to:
 - Compile traditional Linux/Unix apps as-is

3. Architecture

- Embedded Linux
- Modern phone/tablet
- System-on-Chip (SoC)
- Android

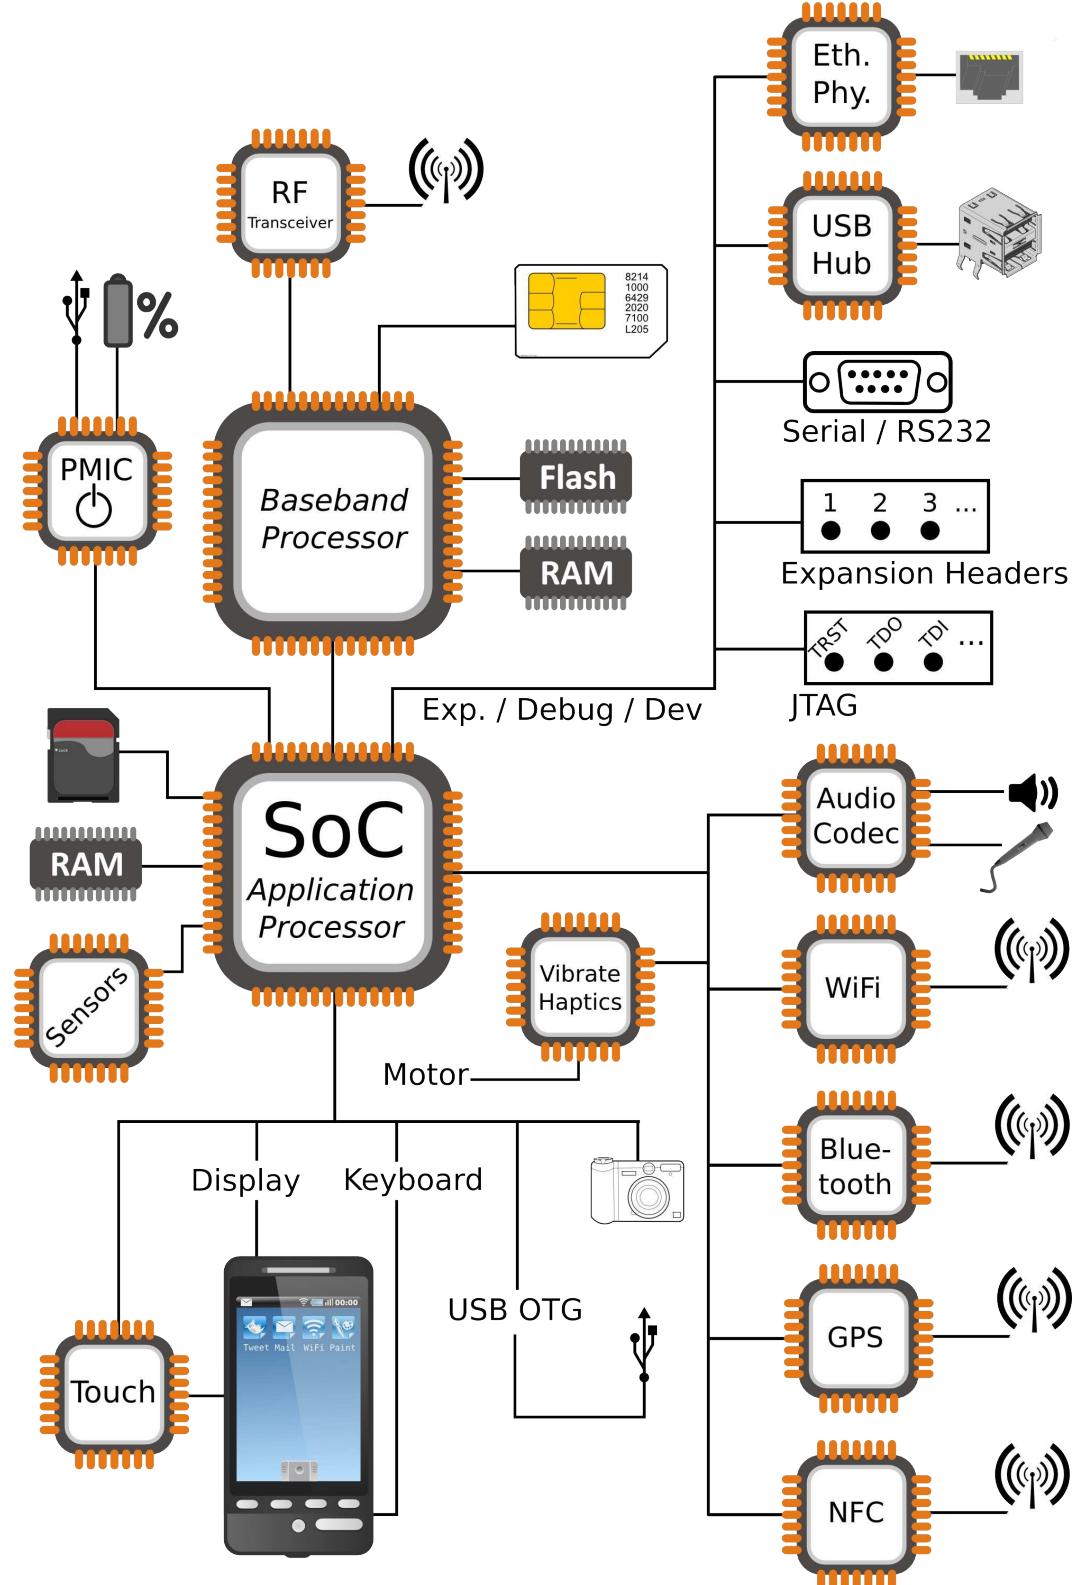

Custom Application

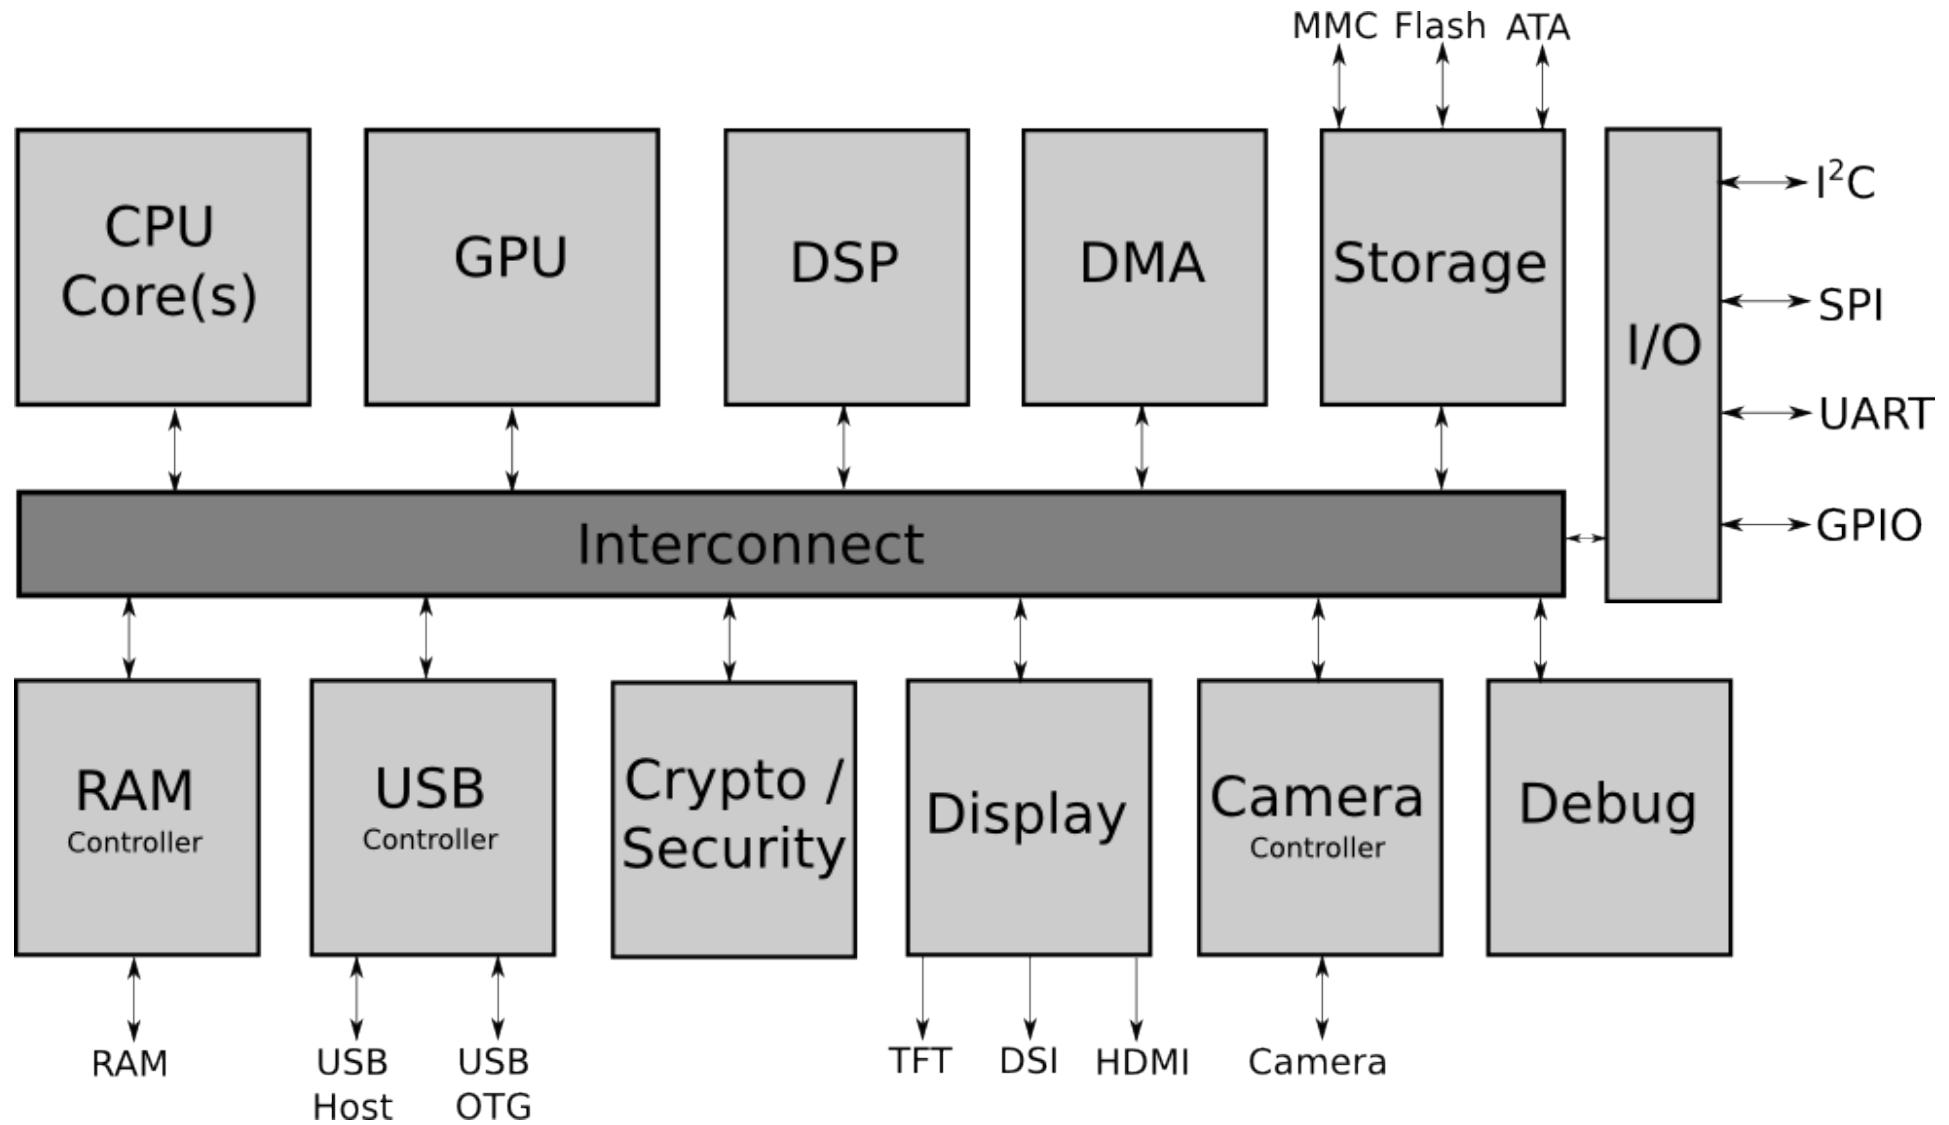

Busybox

Libc
uClibc or eglibc or glibc

4. System Startup

- Bootloader
- Kernel
- Init
- Zygote
- System Server
- Activity Manager
- Launcher (Home)

4.1. Bootloader

- aosp/bootable/bootloader
 - Custom bootloader for Android
 - USB-based
 - Implements the “fastboot” protocol
 - Controlled via “fastboot” cli tool on host
- aosp/bootable/recovery
 - UI-based recovery boot program
 - Accessed through magic key sequence at boot
 - Usually manufacturer specific variant

- Flash layout:

0x000003860000-0x000003900000	:	"misc"	
0x000003900000-0x000003e00000	:	"recovery"	
0x000003e00000-0x000004300000	:	"boot"	Kernel
0x000004300000-0x00000c300000	:	"system"	/system
0x00000c300000-0x0000183c0000	:	"userdata"	/data
0x0000183c0000-0x00001dd20000	:	"cache"	/cache

0x00001dfc0000-0x00001e040000	:	"splash1"	
0x000000300000-0x000001680000	:	"modem"	

From Acer Liquid-E

4.2. Kernel

- Early startup code is very hardware dependent
- Initializes environment for the running of C code
- Jumps to the architecture-independent `start_kernel()` function.
- Initializes high-level kernel subsystems
- Mounts root filesystem
- Starts the init process

4.3. Android Init

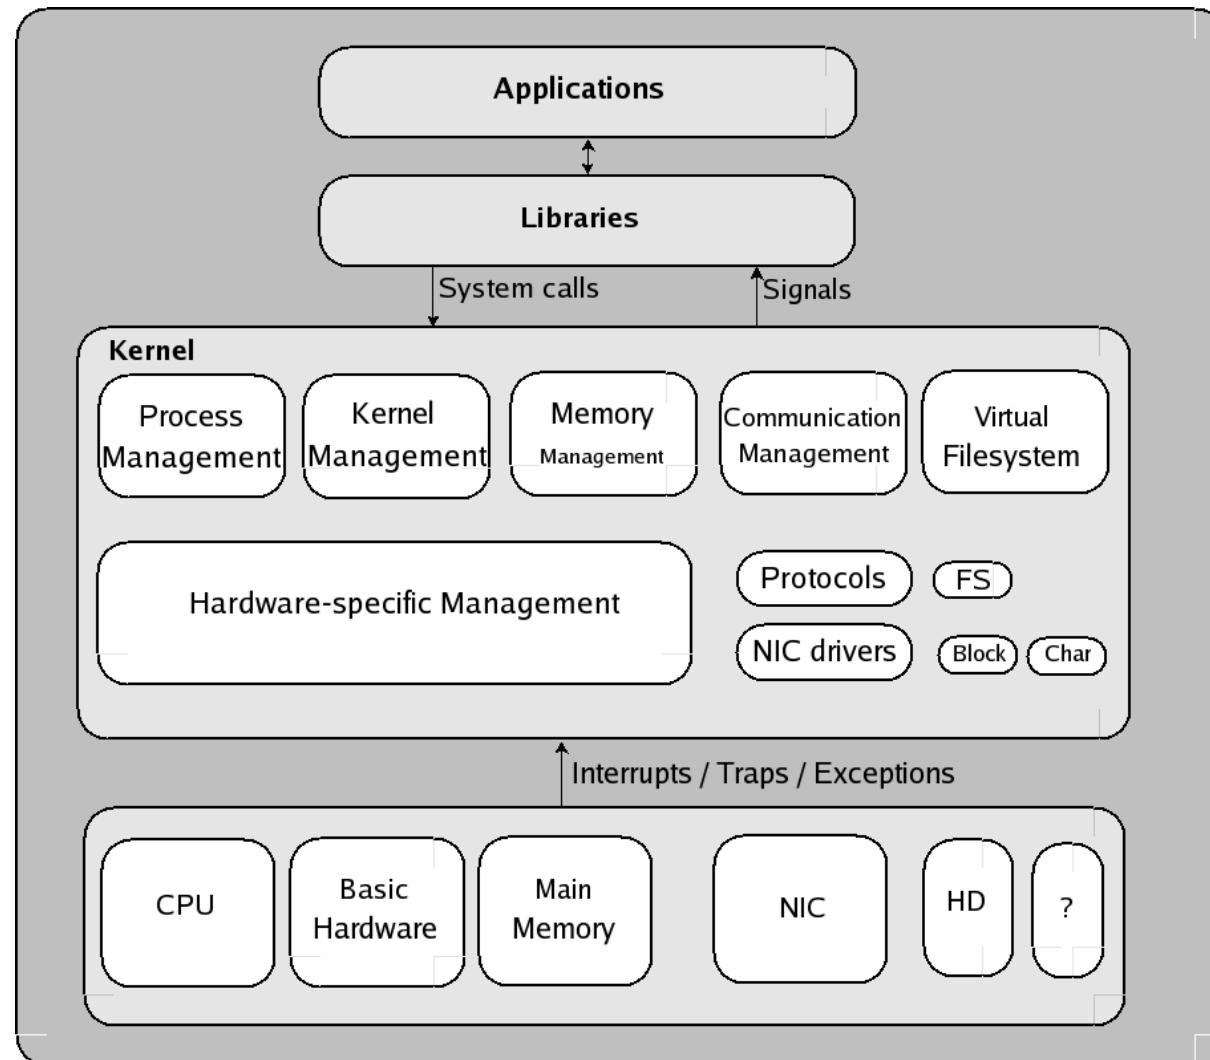

- Open, parses, and runs /init.rc:
 - Create mountpoints and mount filesystems
 - Set up filesystem permissions
 - Set OOM adjustments properties
 - Start daemons:
 - adbd
 - servicemanager (binder context manager)
 - vold
 - netd
 - rild
 - app_process -Xzygote (Zygote)
 - mediaserver
 - ...

4.4. Zygote, etc.

- Init:
 - app_process -Xzygote (Zygote)
- frameworks/base/cmds/app_process/app_main.cpp:
 - runtime.start("com.android.internal.os.Zygote", ...)
- frameworks/base/core/jni/AndroidRuntime.cpp:
 - startVM()
 - Call Zygote's main()
- frameworks/base/core/java/com/android/internal/os/ZygoteInit.java:
 - ...

- `preloadClasses()`
- `startSystemServer()`
- ... magic ...
- Call SystemServer's `run()`
- frameworks/base/services/java/com/android/server/
`/SystemServer.java`:
 - Start **all** system services/managers
 - Start ActivityManager:
 - Send Intent.CATEGORY_HOME
 - Launcher2 kicks in

5. Linux Kernel

5.1. Androidisms

- Wakelocks
- lowmem handler
- Binder
- ashmem – Anonymous Shared Memory
- RAM console
- Logger
- ...

6. Hardware support

Bluetooth	BlueZ through D-BUS IPC (to avoid GPL contamination it seems)
GPS	Manufacturer-provided libgps.so
Wifi	wpa_supplicant
Display	Std framebuffer driver (/dev/fb0)
Keymaps and Keyboards	Std input event (/dev/event0)
Lights	Manufacturer-provided liblights.so
Backlight	
Keyboard	
Buttons	
Battery	
Notifications	
Attention	
Audio	Manufacturer-provided libaudio.so (could use ALSA underneath ... at least as illustrated in their porting guide)
Camera	Manufacturer-provided libcamera.so (could use V4L2 kernel driver underneath ... as illustrated in porting guide)
Power Management	“Wakelocks” kernel patch
Sensors	Manufacturer-provided libsensors.so
Accelerometer	
Magnetic Field	
Orientation	
Gyroscope	
Light	
Pressure	
Temperature	
Proximity	
Radio Layer Interface	Manufacturer-provided libril-<companynamen>-<RIL version>.so

7. Native User-Space

- Mainly
 - /data => User data
 - /system => System components
- Also found:
 - /dev
 - /proc
 - /sys
 - /sbin
 - /mnt
 - /cache
 - Etc.

- Libs:
 - Bionic, SQLite, SSL, OpenGL|ES,
Non-Posix: limited Pthreads support, no SysV IPC
- Toolbox
- Daemons:
 - servicemanager, vold, rild, netd, adbd, ...

8. Dalvik

- Sun-Java =
Java language + JVM + JDK libs
- Android Java =
Java language + Dalvik + Apache Harmony
- Target:
 - Slow CPU
 - Relatively low RAM
 - OS without swap space
 - Battery powered
- Now has JIT

8.1. Dalvik's .dex files

- JVM munches on “.class” files
- Dalvik munches on “.dex” files
- .dex file = .class files post-processed by “dx” utility
- Uncompressed .dex = $0.5 * \text{Uncompressed .jar}$

9. JNI – Java Native Interface

- Call gate for other languages, such as C, C++
- Equivalent to .NET's pinvoke
- Usage: include and call native code from App
- Tools = NDK ... samples included
- Check out “*JNI Programmer's Guide and Specification*” - freely available PDF

10. System Services

Entropy Service	Device Policy	Audio Service
Power Manager	Status Bar	Headset Observer
Activity Manager	Clipboard Service	Dock Observer
Telephone Registry	Input Method Service	UI Mode Manager Service
Package Manager	NetStat Service	Backup Service
Account Manager	NetworkManagement Service	AppWidget Service
Content Manager	Connectivity Service	Recognition Service
System Content Providers	Throttle Service	<i>Status Bar Icons</i>
Battery Service	Accessibility Manager	DiskStats Service
Lights Service	Mount Service	ADB Settings Observer
Vibrator Service	Notification Manager	
Alarm Manager	Device Storage Monitor	
Init Watchdog	Location Manager	
Sensor Service	Search Service	
Window Manager	DropBox Service	
Bluetooth Service	Wallpaper Service	

System Services

System Server

Java-built Services

Power Manager Mount Service
Activity Manager Notification Manager
Package Manager Location Manager
Battery Service Search Service
Window Manager Wallpaper Service
Status Bar Headset Observer
Clipboard Service ...

C-built Services

Sensor Service

Surface Flinger

Media Service

Audio Flinger
Media Player Service
Camera Service
Audio Policy Service

Includes:
• StageFright
• Audio effects
• DRM framework

Phone App

JNI

Native Methods for
Java-built Services

Hardware Abstraction Layer

11. Calling on System Services

- Use getSystemService
- Ex: NotificationManager Object reference:

```
String ns = Context.NOTIFICATION_SERVICE;
```

```
NotificationManager mNotificationManager = (NotificationManager) \\\ngetSystemService(ns);
```

- Prepare your content
- Call on the object:

```
mNotificationManager.notify(HELLO_ID, notification);
```

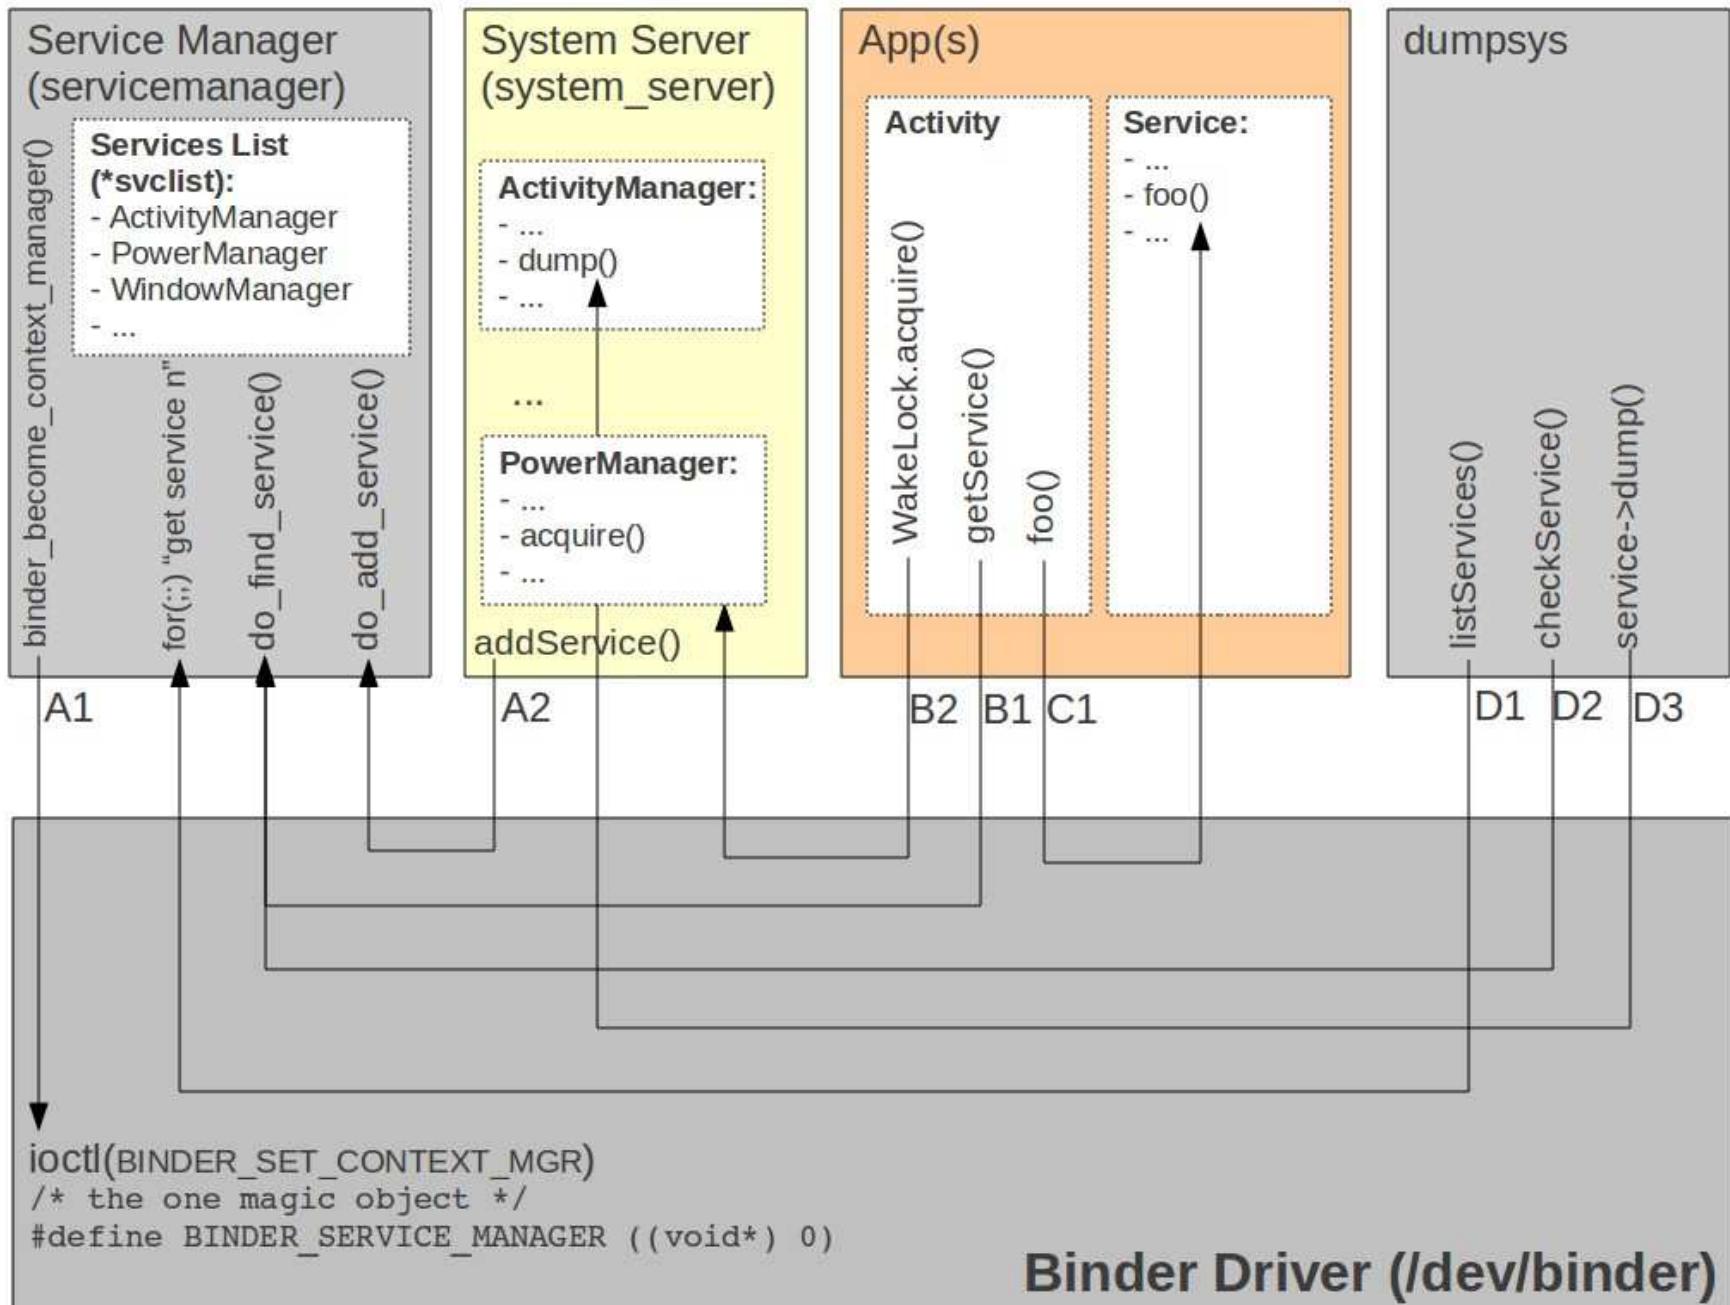

12. ActivityManager

- Start new Activities, Services
- Fetch Content Providers
- Intent broadcasting
- OOM adj. maintenance
- Application Not Responding
- Permissions
- Task management
- Lifecycle management

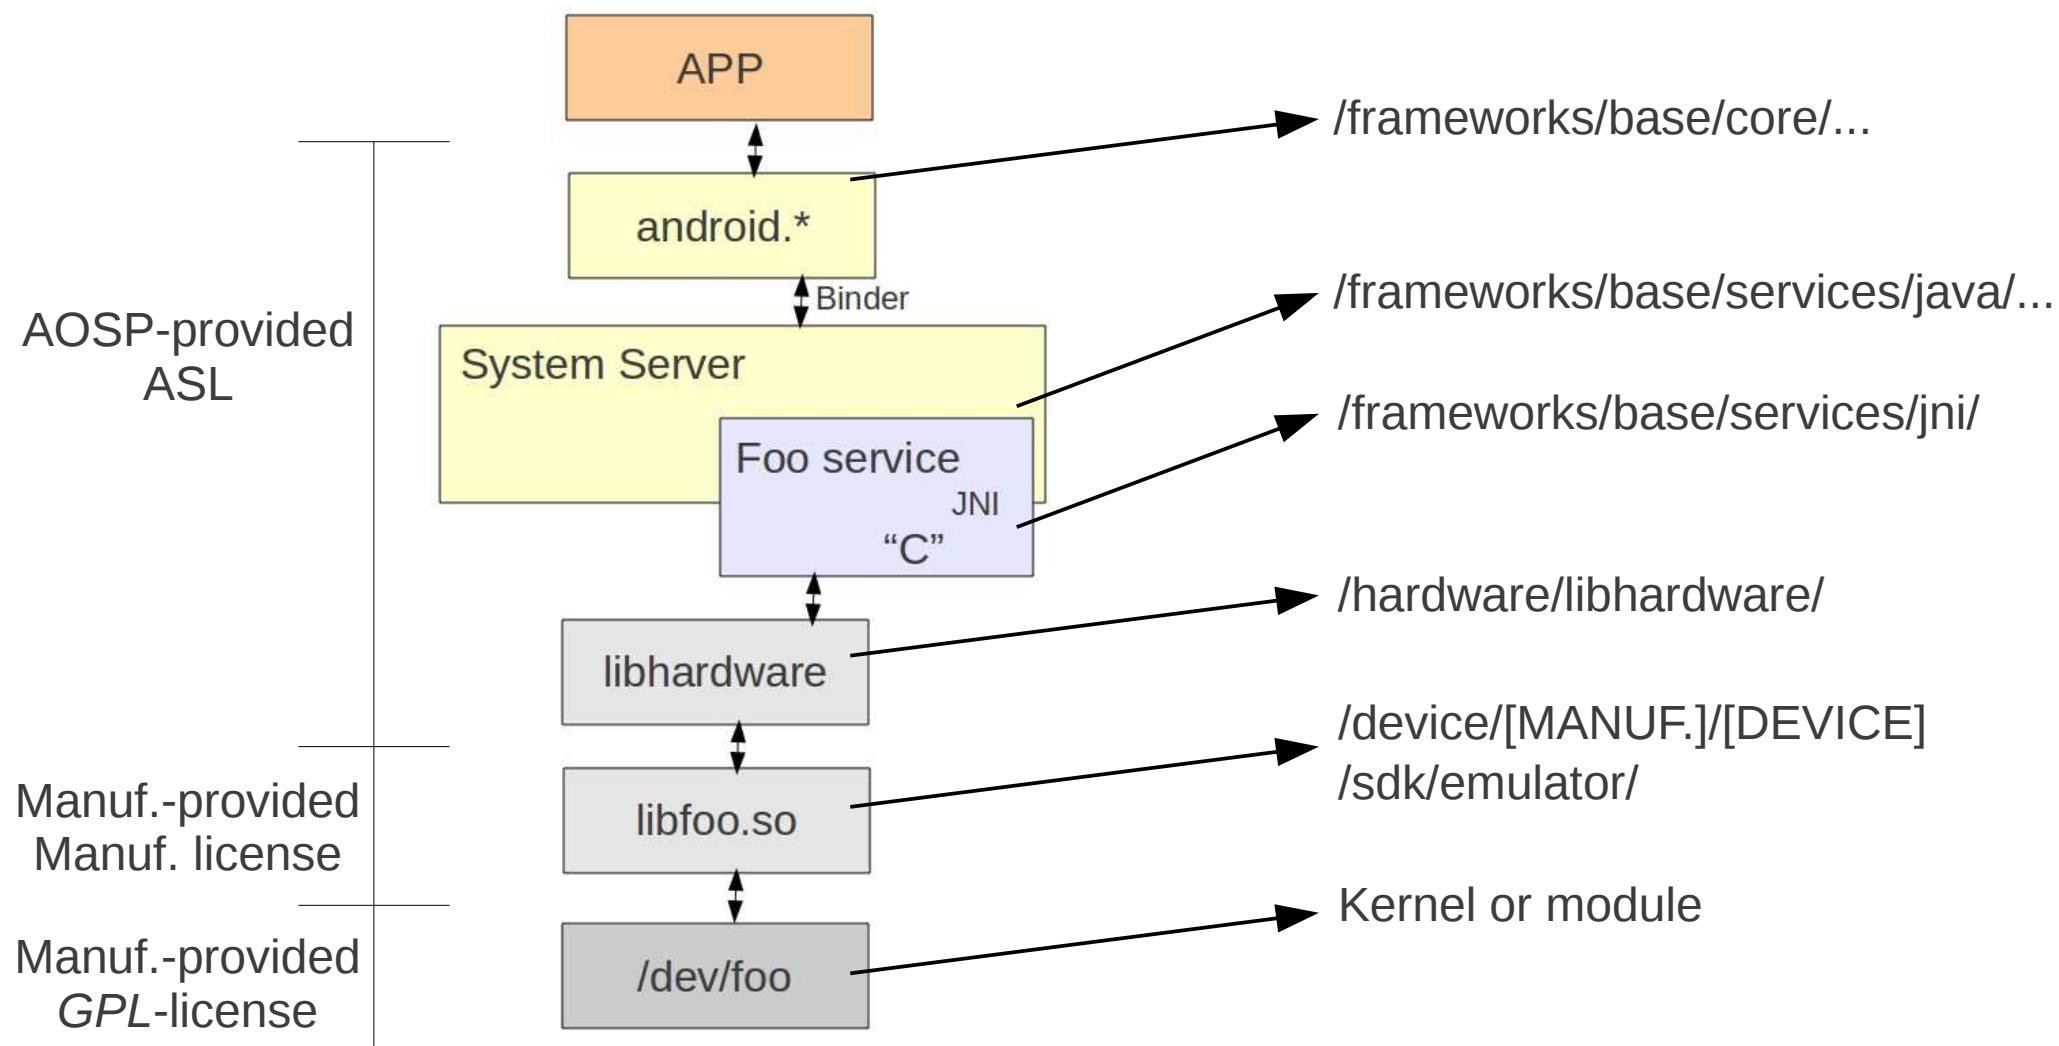

- Ex. starting new app from Launcher:
 - onClick(Launcher)
 - startActivityForResult(Activity.java)
 - <*Binder*>
 - ActivityManagerService
 - startViaZygote(Process.java)
 - <*Socket*>
 - Zygote

13. Binder

- CORBA/COM-like IPC
- Data sent through “parcels” in “transactions”
- Kernel-supported mechanism
- /dev/binder
- Check /proc/binder/*
- android.* API connected to System Server through binder.

14. Hardware Abstraction Layer

15. Stock AOSP Apps

/packages/apps		/packages/providers	/packages/inputmethods
AccountsAndSettings	Launcher2	ApplicationProvider	LatinIME
AlarmClock	Mms	CalendarProvider	OpenWnn
Bluetooth	Music	ContactsProvider	PinyinIME
Browser	PackageInstaller	DownloadProvider	
Calculator	Protips	DrmProvider	
Calendar	Provision	GoogleContactsProvider	
Camera	QuickSearchBox	MediaProvider	
CertInstaller	Settings	TelephonyProvider	
Contacts	SoundRecorder	UserDictionaryProvider	
DeskClock	SpeechRecorder		
Email	Stk		
Gallery	VoiceDialer		
HTMLViewer			

Working with the Android Open Source Project

- Tools and location
- Content
- Building
- Build tricks
- Build system architecture
- Output images
- Using adb
- Custom toolchains and dev kits
- Compatibility Test Suite
- Basic hacks

1. Tools and location

- Location:

- <http://android.googlesource.com/>

- Get “repo”:

```
$ curl https://dl-ssl.google.com/dl/googlesource/git-repo/repo > ~/bin/repo
```

```
$ chmod a+x ~/bin/repo
```

- Fetch the AOSP:

- Make sure you fetch a tagged release

- Jelly Bean:

```
$ repo init -u https://android.googlesource.com/platform/manifest  
-b android-4.2.2_r1
```

```
$ repo sync
```

2. Content

bionic	C library replacement
bootable	Reference bootloader
build	Build system
cts	Compatibility Test Suite
dalvik	Dalvik VM
development	Development tools
device	Device-specific files and components
external	Copy of external projects used by AOSP
frameworks	System services, android.*, Android-related cmd's, etc.
hardware	Hardware support libs
libcore	Apache Harmony
ndk	The NDK
packages	Stock Android apps, providers, etc.
prebuilt	Prebuilt binaries
sdk	The SDK
system	pieces of the world that are the core of the embedded linux platform at the heart of Android.

Stock Android Apps

Linux Kernel

N/A, the kernel isn't part of the AOSP tree

3. Building

- Requires 64-bit Ubuntu 10.04
- Packages required:

```
$ sudo apt-get install build-essential libc6-dev \
> ia32-libs lib32z1 bison flex gperf git-core \
> g++_libc6-dev-i386 libz-dev libx11-dev \
> libstdc++6 lib32ncurses5 lib32ncurses5-dev \
> g++-multilib
```

- Possibly fix a few symbolic links:

```
$ sudo ln -s /usr/lib32/libstdc++.so.6 /usr/lib32/libstdc++.so
$ sudo ln -s /usr/lib32/libz.so.1 /usr/lib32/libz.so
```

- Set up build environment:

```
$ . build/envsetup.sh
```

```
$ lunch
```

- Launch build and go watch tonight's hockey game:

```
$ make -j2
```

- ... though you should check your screen at breaks ...

- Just launch emulator when it's done:

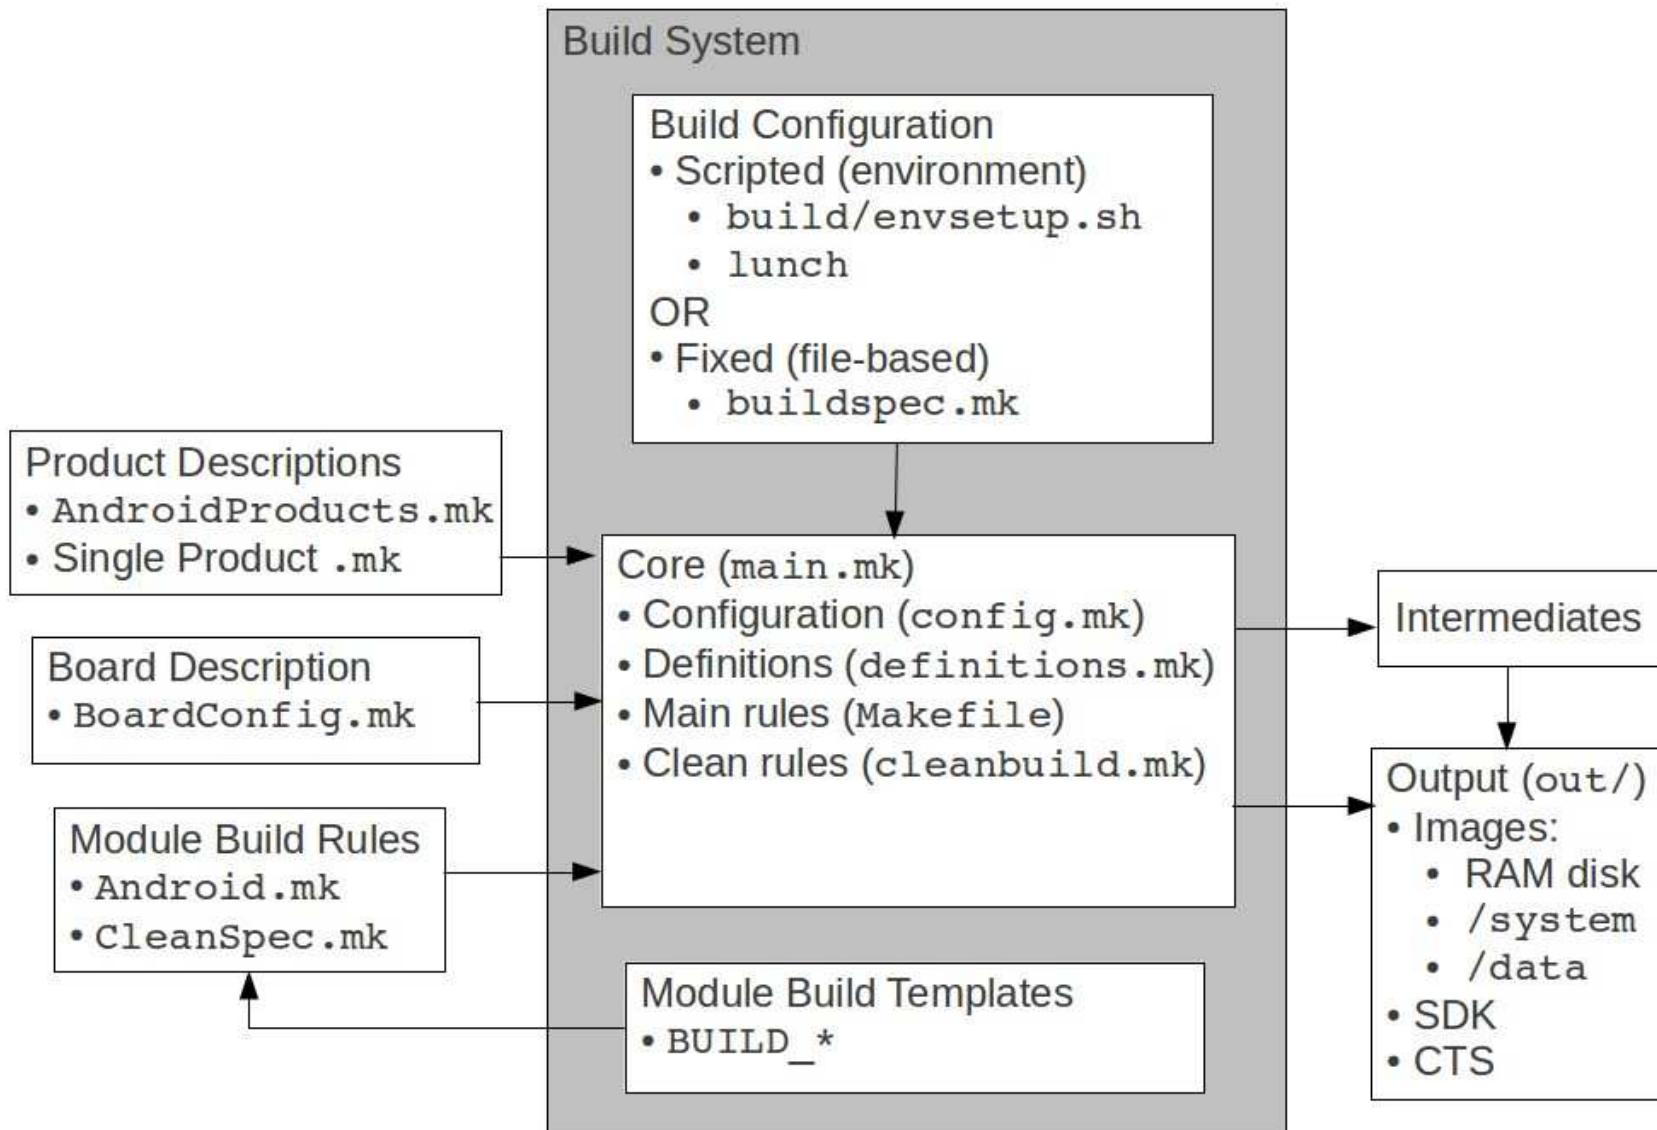

```
$ emulator &
```

- Need to reuse envsetup.sh and lunch on every new shell

4. Build Tricks

- Commands (from build/envsetup.sh):
 - godir
 - croot
 - mm
 - m
- Speeding up the Build:
 - CPU
 - RAM
 - SSD
 - CCACHE
 - \$ export USE_CCACHE=1

5. Build System Architecture

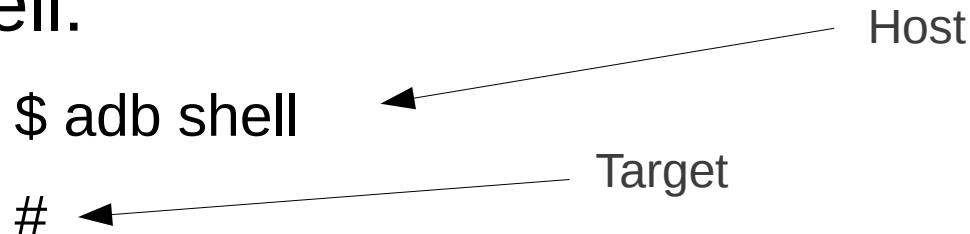

6. Output Images

- All output and build in [aosp]/out/
- Images at [aosp]/out/target/product/generic/:
 - ramdisk.img
 - system.img
 - userdata-qemu.img
- Kernel is in:
 - prebuilt/android-arm/kernel/kernel-qemu
- Emulator overrides:
 - -kernel
 - -initrd

7. Using adb

- Can use to control/interface w/ running AOSP, including emulator.
- Shell:

- Dumping the log:

```
$ adb logcat
```

- Copying files to/from target:

```
$ adb push foo /data/local
```

```
$ adb pull /proc/config.gz
```

8. Custom Toolchains and Dev Kits

- Rationale
- SDK generation
- NDK generation

8.1. Rationale

- SDK:
 - Providing other internal teams or external developers access to your modified/custom Android APIs.
- NDK:
 - Same as SDK rationale
- Custom cross-dev toolchain:
 - To avoid having to use a binary toolchain from 3rd party.
 - To control the build parameters used to create the toolchain. Ex.: use uClibc instead of glibc.

8.2. SDK generation

- Building the SDK:

```
$ . build/envsetup.sh
```

```
$ lunch sdk-eng
```

```
$ make sdk
```

- If API modified, do this before make:

```
$ make update-api
```

- Location: [aosp]/out/host/linux-x86/sdk/

- Using a custom SDK:

- Eclipse->Window->Preferences->Android->"SDK Location"
- Eclipse->Window->"Android SDK and AVD Manager"->"Installed Packages"->"Update All..."

8.3. NDK generation

- Build

```
$ cd ndk/build/tools
```

```
$ export ANDROID_NDK_ROOT=[aosp]/ndk
```

```
$ ./make-release --help
```

```
$ ./make-release
```

IMPORTANT WARNING !!

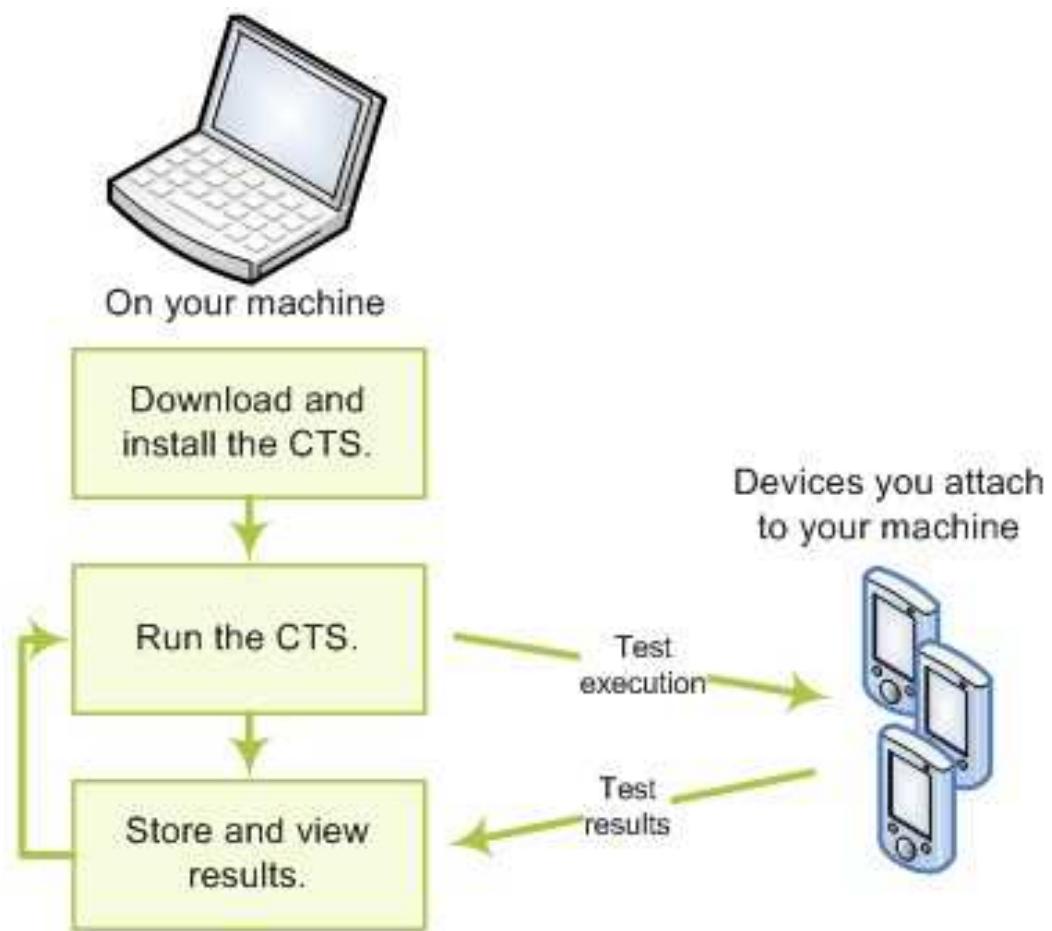

This script is used to generate an NDK release package from scratch
for the following host platforms: linux-x86

This process is EXTREMELY LONG and may take SEVERAL HOURS on a dual-core
machine. If you plan to do that often, please read docs/DEVELOPMENT.TXT
that provides instructions on how to do that more easily.

Are you sure you want to do that [y/N]

9. Compatibility Test Suite

- Android Compatibility Program:
 - Source code to Android stack
 - Compatibility Definition Document (CDD) – Policy
 - Compatibility Test Suite (CTS) – Mechanism
- Each Android version has own CDD & CTS
- CTS:
 - Part of AOSP
 - Run from host using USB over to attached device
 - Based on JUnit
 - Runs various test apps on target
 - Relies on ADB
 - Provides report to be analyzed and/or sent back to Google

- Report:
 - .zip file containing XML files and screen-shots
 - Sent to: cts@android.com
- Building the CTS:

```
$ . build/envsetup.sh
```

```
$ make cts
```

- Launching the CTS:

```
$ cd out/host/linux-x86/bin/
```

```
$ ./cts
```

```
$ cts_host >
```

```
$ cts_host > help
```

...

- Using the CTS:

```
$ cts_host > ls --plan
```

List of plans (8 in total):

Signature

RefApp

VM

Performance

AppSecurity

Android

Java

CTS

```
$ ./cts start --plan CTS
```

- Areas covered:
 - Signature tests
 - Platform API tests
 - Dalvik VM tests
 - Platform Data Model
 - Platform Intents
 - Platform Permissions
 - Platform Resources

10. Basic Hacks

- Add device
- Add app
- Add app overlay
- Add native tool or daemon
- Add native library

10.1. Adding a new device

- Create directory in device/:
 - device/acme/coyotepad/
- Makefile checklist:
 - AndroidProducts.mk
 - full_coyotepad.mk
 - BoardConfig.mk
 - Android.mk
- Menu integration:
 - vendorsetup.sh

10.1.1. AndroidProducts.mk

```
PRODUCT_MAKEFILES := \
$(LOCAL_DIR)/full_coyotepad.mk
```

10.1.2. full_coyotepad.mk

```
$(call inherit-product, $(SRC_TARGET_DIR)/product/languages_full.mk)

# If you're using 4.2/Jelly Bean, use full_base.mk instead of
full.mk

$(call inherit-product, $(SRC_TARGET_DIR)/product/full.mk)

DEVICE_PACKAGE_OVERLAYS :=
PRODUCT_PACKAGES +=
PRODUCT_COPY_FILES +=
PRODUCT_NAME := full_coyotepad
PRODUCT_DEVICE := coyotepad
PRODUCT_MODEL := Full Android on CoyotePad, meep-meep
```

10.1.3. BoardConfig.mk

```
TARGET_NO_KERNEL := true  
TARGET_NO_BOOTLOADER := true  
TARGET_CPU_ABI := armeabi  
BOARD_USES_GENERIC_AUDIO := true  
USE_CAMERA_STUB := true
```

10.1.4. Android.mk

```
LOCAL_PATH := $(call my-dir)

include $(CLEAR_VARS)

ifeq ($(filter coyotepad,$(TARGET_DEVICE)),)
include $(call all-makefiles-under,$(LOCAL_PATH))
endif
```

10.1.5. vendorsetup.sh

```
add_lunch_combo full_coyotepad-eng
```

10.2. Adding new applications

- Can use Eclipse to create initial version
- Copy Eclipse project to packages/apps
- Local:
 - Add app to device/acme/coyotepad/
 - Add Android.mk to app
 - Add to PRODUCT_PACKAGES in full_coyotepad.mk
- Global:
 - Add application in [aosp]/packages/apps
 - Add an appropriate Android.mk file to project
 - Add project to PRODUCT_PACKAGES in [aosp]/build/target/product/core.mk

```
LOCAL_PATH:= $(call my-dir)

include $(CLEAR_VARS)

LOCAL_MODULE_TAGS := optional

LOCAL_SRC_FILES := $(call all-java-files-under, src)

LOCAL_PACKAGE_NAME := HelloWorld

include $(BUILD_PACKAGE)
```

10.3. Adding an app overlay

- device/acme/coyotepad/overlay/
- full_coyotepad.mk:
 - DEVICE_PACKAGE_OVERLAYS :=
device/acme/coyotepad/overlay

10.4. Adding a native tool or daemon

- Local:
device/acme/coyotepad/
- Global:
 - system/core/
 - system/
 - frameworks/base/cmds/
 - frameworks/native/cmds/
 - external/

```
LOCAL_PATH:= $(call my-dir)

include $(CLEAR_VARS)

LOCAL_MODULE := hello-world

LOCAL_MODULE_TAGS := optional

LOCAL_SRC_FILES := hello-world.cpp

LOCAL_SHARED_LIBRARIES := liblog

include $(BUILD_EXECUTABLE)
```

10.5. Add a native library

- Local:
device/acme/coyotepad/
- Global:
 - system/core/
 - frameworks/base/libs/
 - frameworks/native/libs/
 - external/
- In <= 2.3:
 - See build/core/prelink-linux-arm.map

```
LOCAL_PATH:= $(call my-dir)

include $(CLEAR_VARS)

LOCAL_MODULE := libmylib

LOCAL_MODULE_TAGS := optional

LOCAL_PRELINK_MODULE := false

LOCAL_SRC_FILES := $(call all-c-files-under, .)

include $(BUILD_SHARED_LIBRARY)
```

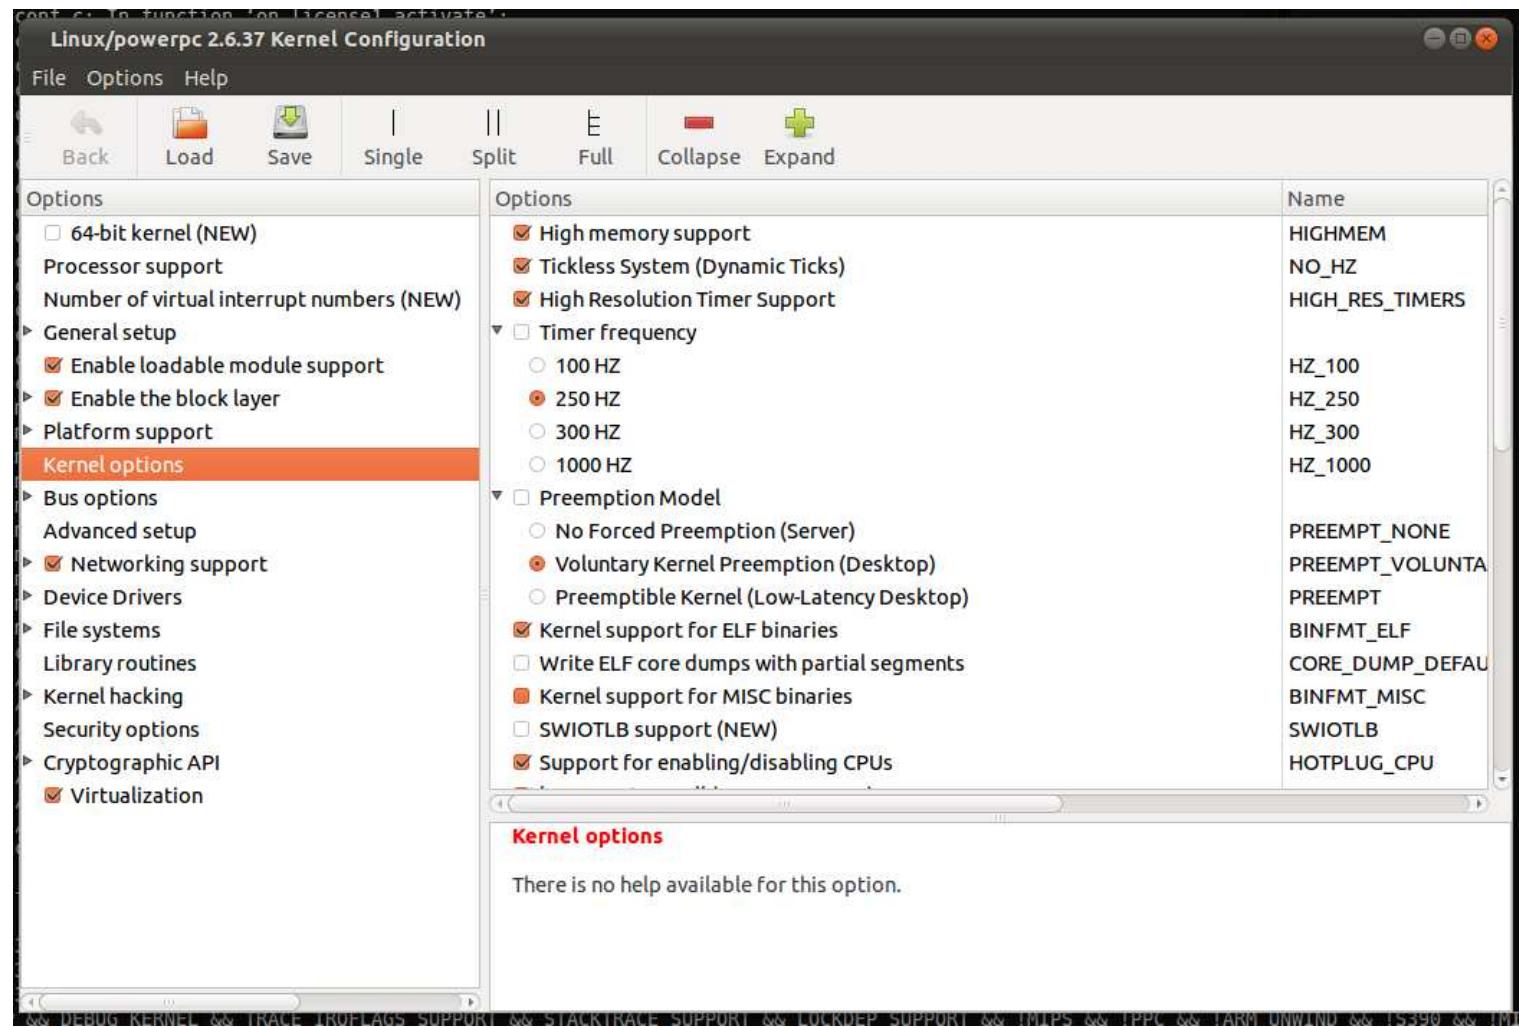

Kernel basics

1. Selecting a kernel
2. Configuring the kernel
3. Compiling the kernel
4. Installing the kernel
5. Useful boot parameters
6. Kernel patches

1. Selecting a kernel

- Google:
 - <http://android.googlesource.com>
- Vanilla:
 - <http://www.kernel.org>
- ~~Either way ... you're screwed:~~
 - ~~Android kernel is a fork~~
 - ~~No resolution in sight~~
 - ~~Cannot use vanilla kernel as-is ... androidisms~~
- Kernel 3.3 has most Androidisms ... except:
 - Wakelocks

2. Configuring the kernel

- Main options:
 - Processor support
 - General setup
 - Enable loadable module support
 - Enable the block layer
 - Platform support
 - Kernel options
 - Bus options
 - Advanced setup
 - Networking support
 - Device Drivers
 - File systems
 - Library routines
 - Kernel hacking
 - Security options
 - Cryptographic API

- Kernel architecture name (ARCH=):
 - x86 => x86
 - ARM => arm
 - PPC => powerpc
 - mips => mips
 - sh => sh
- Some options are visible only to certain archs

- The fact that an option is displayed doesn't mean it's supported.
- The fact that an option isn't displayed doesn't mean it isn't supported.
- Configuration methods:
 - make config
 - make oldconfig
 - make menuconfig
 - make xconfig
- All config methods generate a .config file

- Configs will also generate headers & symlinks
- Set up temporary env. var. for cross-building:

```
$ export TARGET=[your_aosp]/prebuilt/linux-x86/toolchain/arm-eabi-4.4.0/bin/arm-eabi
```

- To start configuration menu for your target:

```
$ make ARCH=arm CROSS_COMPILE=${TARGET}- menuconfig
```
- Some items can be configured as modules and loaded dynamically at runtime.
- Once the configuration is done, quit the menu and save your configuration. This will create a .config file.
- Some targets have preset configurations:

```
$ make ARCH=arm CROSS_COMPILE=${TARGET}- \
> davinci_all_defconfig
```

- Can use the menus provided by menuconfig and xconfig to load and save various configurations.
- Simplest way to manipulate configurations: copy the .config files by hand.
- To reuse an old configuration, simply copy the .config back to the kernel's tree and:

```
$ make ARCH=arm CROSS_COMPILE=${TARGET}- oldconfig
```

- Place all your .config files in your \${PRJROOT}/kernel directory for easy access.
- Rename your .config files using meaningful names: 2.6.37.config, 2.6.37-frame-buf.config, ...

3. Compiling the kernel

1. Building the kernel:

- Command:
`$ make ARCH=arm CROSS_COMPILE=${TARGET}- zImage`
- Generates a kernel image compressed via gzip
- zImage may not be valid target. Other targets include: vmlinux, bzImage, ulimage, culmage, ...
- Use “make ARCH=... help” to find out valid targets
- ARCH variable indicates which architecture subdirectory is to be used.
- CROSS_COMPILE is used to form the name of the tools. For example, \$(CROSS_COMPILE)gcc becomes arm-linux-gcc. Hence the trailing “-”.

2. Building the modules:

```
$ make ARCH=arm CROSS_COMPILE=${TARGET}- modules
```

- **IF YOU NEED TO** restore kernel tree to distribution state:

```
$ make ARCH=arm CROSS_COMPILE=${TARGET}- distclean
```

4. Installing the kernel¹

- Managing multiple kernel images:
 - Images in \${PRJROOT}/images must be properly identified.
 - For each kernel, there are 4 files to put in \${PRJROOT}/images:
 - The uncompressed image => vmlinuz
 - The compressed image => depends on arch
 - The kernel symbols => System.map
 - The kernel configuration file => .config
 - Compressed image is *usually* in the arch/YOUR_ARCH/boot directory.

1. This is for **future** reference. \${PRJROOT} is undefined at this point

- See the exercise set for target image we are using.
- Location of images can be seen by looking at arch/YOUR_ARCH/Makefile
- Images placed in \${PRJROOT}/images must follow same naming convention as .config file:

```
$ cp arch/arm/boot/zImage \
> ${PRJROOT}/images/zImage-2.6.37
$ cp System.map ${PRJROOT}/images/System.map-2.6.37
$ cp vmlinuz ${PRJROOT}/images/vmlinuz-2.6.37
$ cp .config ${PRJROOT}/images/2.6.37.config
```

- Installing the kernel modules:
 - Must install modules in directory following the previously adopted naming convention:

```
$ make ARCH=arm CROSS_COMPILE=${TARGET}- \
> INSTALL_MOD_PATH=${PRJROOT}/images/modules-2.6.37 \
> modules_install
```
 - INSTALL_MOD_PATH is prepended to the default /lib/modules. Hence, modules installed in:
\${PRJROOT}/images/modules-2.6.37/lib/modules

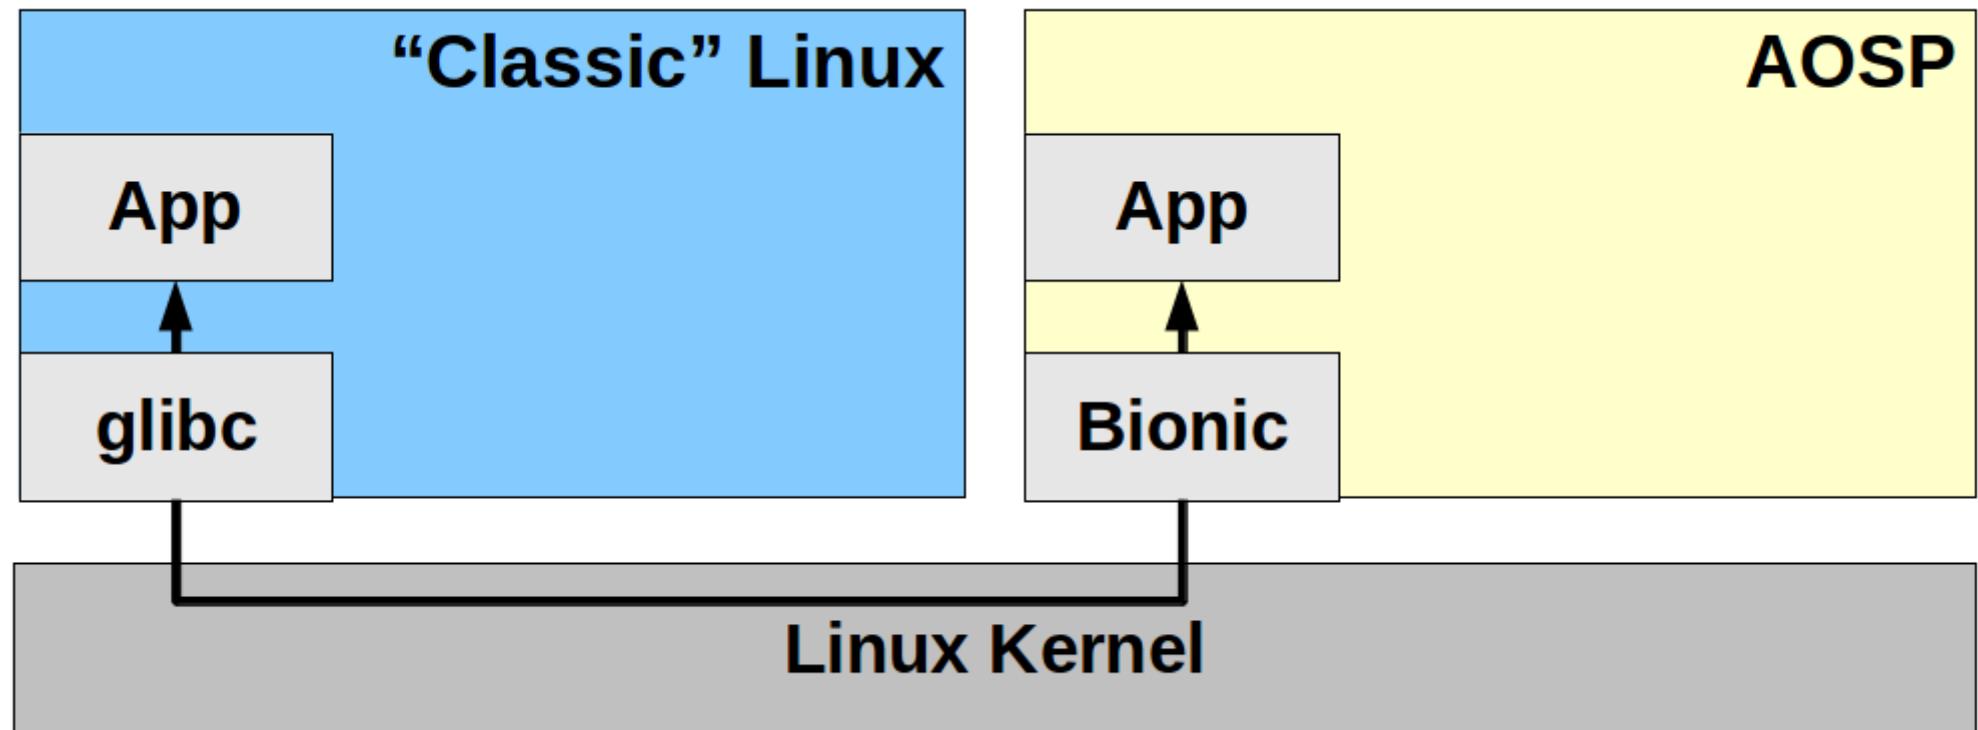

Embedded Linux Root FS

1. Legacy Integration
2. Architecture
3. Tools
4. Embedded Linux Workspace
5. Basic root filesystem structure
6. Libraries
7. Kernel modules
8. Device files
9. Main system applications
10. Auto-generating filesystems
11. Creating a cross-development toolchain

1. Legacy Integration

- What if I ... ?:
 - have been using my custom rootfs forever
 - really need glibc
 - have a huge stack based on “legacy Linux”
 - don't want to deal with AOSP's build system
 - want BusyBox
 - want to unify with a std Linux desktop
 - need things the AOSP doesn't provide
 - have a ton of Linux drivers and want those to be used by Android
 - ...
- Know this: filesystem integration is trivial:
 - Change build system to copy your custom rootfs
 - Change init scripts to start you own daemons
 - Use sockets to communicate
- Know this too: std Linux desktop integration is NOT

2. Architecture

Host

AOSP (bionic)

build/
system/
frameworks/
packages/
external/

PRJROOT (glibc)

sysapps/
rootfs/
build-tools/
.../

Kernel

Target

- ramdisk.img => /
 - /bin
 - /lib
- system.img => /system
- userdata.img => /data

Kernel

3. Tools

- GNU cross-development toolchain:
 - gcc - compiler
 - as - assembler
 - ld - linker
 - gdb/gdbserver - debugger
 - etc.
- C library: uClibc, eglIBC or glibc

4. Embedded Linux Workspace

- Need to organize the components used during cross-platform development. Workspace layout:

bootldr:	target bootloader (s)
build-tools:	toolchain build packages and sources
debug:	debugging tools
doc:	project documentation
images:	binary images ready to be used on target
kernel:	sources and build directories for target kernels
project:	your own custom code for the target
rootfs:	root filesystem as seen on the target
sysapps:	sources for target's system applications
tmp:	temporary data and experiments
tools:	toolchain and all other tools required to build software for the target.

4.1. Workspace env. vars. script

- Complete workspace script (devex)

```
export PROJECT=emblinux
export PRJROOT=/home/karim/${PROJECT}
export TARGET=arm-unknown-linux-gnueabi
export PATH=${PATH}:[$BBONE_WS_DIR]/bin
cd $PRJROOT
```

- To use this script:

```
$ ._devex
```

- Possible values for \$TARGET:

- ARM: arm-linux, arm-unknown-linux-gnueabi
- MIPS: mips-linux, mipsel-unknown-linux-gnu
- I386: i386-linux, i586-geode-linux-uclibc

5. Basic root filesystem structure

- Unix FS structured for multi-user systems
- Some directories not necessary for embedded
- Filesystem Hierarchy Standard (FHS):
 - /bin => Essential user binaries
 - /boot => Bootloader and kernel images
 - /dev => Device files
 - /etc => System configuration
 - /home => User home directories
 - /lib => Essential shared libs and kernel modules
 - /mnt => Temporary mount point
 - /opt => Add-on software packages
 - /sbin => Essential system binaries
 - /tmp => Temporary files
 - /usr => Secondary hierarchy (mostly user apps)
 - /var => Variable data generated by daemons

- Non-essential multi-user dirs:
 - /home, /mnt, /opt, /root
- Depends on bootloader:
 - /boot
- ***Traditionally*** “essential”:
 - /bin, /dev, /etc, /lib, /proc, /sbin, /usr, /tmp, /var
- Careful with “/etc”, Android needs it to point to “/system/etc” for Dbus config ... Just hack it.
- Contain their own hierarchy:
 - /usr, /var

- What are all these binaries directories for?
 - /bin => Essential binaries for user and admin
 - /sbin => Essential binaries for admin
 - /usr/bin => Non-essential user and admin binaries
 - /usr/sbin=> Non-essential admin binaries
- What are all those libraries directories for?
 - /lib => Essential system libraries
 - /usr/lib => Non-essential libraries
- The kernel does not force FS layout. Layout is “universally” agree upon (i.e. FHS.)

- To start working on rootfs:

```
$ cd ${PRJROOT}/rootfs
```

- Create core rootfs directories:

```
$ mkdir bin lib sbin usr var
```

- Create the /usr hierarchy:

```
$ mkdir usr/{bin,lib,sbin}
```

- Create the /var hierarchy:

```
$ mkdir var/{lib,lock,log,run,tmp}
```

```
$ chmod 1777 var/tmp
```

6. Libraries

1.glibc

2.uClibc

6.1. glibc

- glibc components:
 - Actual shared libraries:
 - Format: libLIB_NAME-GLIBC_VER.so
 - Examples: libm-2.3.2.so, libc-2.3.2.so
 - Major revision version symbolic links:
 - Format: libLIB_NAME.so.MAJOR_REV_VER
 - Examples: libdl.so.2, libc.so.6
 - Version-independent symbolic links to the major revision version symbolic links:
 - Format: libLIB_NAME.so
 - Examples: libdl.so, libm.so
 - Static library archives:
 - Format: libLIB_NAME.a
 - Examples: libdl.a, libm.a

- For target, need:
 - The actual shared libs
 - The major revision version symbolic links
- Also need dynamic linker:
 - Actual linker: ld-GLIBC_VER.so
 - Symbolic link to linker:
 - x86, ARM, SH, m68k => ld-linux.so.MAJOR_REV_VER
 - MIPS, PPC => ld.so.MAJOR_REV_VER
- Must determine exact library components required.
- BELS table 6.2 contains complete list

- Most important components:
 - ld => the dynamic linker
 - libc => the C library
 - libm => the math library
 - libdl => the shared objects manipulation library
- Must determine exact dependencies of your applications.
- Native ldd is not cross-platform-capable
- Can use readelf or uclibc-ldd:

- Using readelf:

```
$ arm-linux-readelf -a ${PRJROOT}/rootfs/bin/busybox \
> | grep "Shared library"
0x00000001 (NEEDED)                               Shared library: [libc.so.0]
```

- Using uclibc-ldd:

```
$ arm-uclibc-ldd ${PRJROOT}/rootfs/bin/busybox
libc.so.0 => /home/karim/example-sys/tools/uclibc/lib/libc.so.0
/lib/ld-uClibc.so.0 => /lib/ld-uClibc.so.0
```

- Copying important libraries to target rootfs:

```
$ cd ${TARGET_PREFIX}/lib
$ for file in libc libcrypt libdl libm \
> libpthread libresolv libutil
> do
> cp $file-*.* ${PRJROOT}/rootfs/lib
> cp -d $file.so.[*0-9] ${PRJROOT}/rootfs/lib
> done
$ cp -d ld*.so* ${PRJROOT}/rootfs/lib
```

- Copying all libraries:

```
$ cp -d [BBONE_WS_DIR]/tools/arm-unknown-linux-gnueabi/arm-  
unknown-linux-gnueabi/lib/* ${PRJROOT}/rootfs/lib
```

- Stripping all target libraries for space efficiency:

```
$ arm-unknown-linux-gnueabi-strip ${PRJROOT}/rootfs/lib/*.so*
```

6.2. uClibc

- Same naming conventions as glibc
- Implements most of the glibc components:
 - ld, libc, libcrypt, libdl, libm, libpthread, libresolv, libutil.
- uClibc libraries can coexist with glibc libraries in target's /lib directory.
- Copying important libraries to target rootfs:

```
$ cd ${PREFIX}/uClibc/lib  
$ for file in libuClibc ld-uClibc libc libdl \  
> libcrypt libm libresolv libutil  
> do  
> cp $file-*.*so ${PRJROOT}/rootfs/lib  
> cp -d $file.so.[*0-9] ${PRJROOT}/rootfs/lib  
> done
```

- Copying all uClibc components:

```
$ cd ${PREFIX}/uClibc/lib  
$ cp *-*.*so ${PRJROOT}/rootfs/lib  
$ cp -d *.so.[*0-9] ${PRJROOT}/rootfs/lib
```

- No need to strip uClibc libraries, they are stripped by the uClibc build script.

7. Kernel modules

- Kernel modules are located in /lib/modules, so they must be installed in \${PRJROOT}/rootfs/lib/modules.
- Copying modules built earlier:

```
$ cp -a ${PRJROOT}/images/modules-2.6.37/* \
> ${PRJROOT}/rootfs
```
- Module loading customization (/etc/modprobe.conf or /etc/modprobe.d/)

8. Device files

- All devices in Linux are seen as files (except Ethernet interfaces.)
- Typical workstation distros use udev
- Keep a copy of Documentation/devices.txt handy
- See BELS table 6.3 for core set of /dev entries
- Properties of each /dev node:
 - Filename (node name)
 - Type (char / block)
 - Major number (What type of device?)
 - Minor number (Which instance of the device?)
 - Permission bits
- No need to create these entries since AOSP does it for us

9. Main system applications

- Unix systems rely on a common set of commands
- Standard distros have one binary per command
- May compile each relevant command one-by-one or use packages that provide many commands in a single binary:
 - 1.Busybox
 - 2.Distro

9.1. BusyBox

- Main package used in embedded Linux to provide core set of Unix commands: `busybox.net`

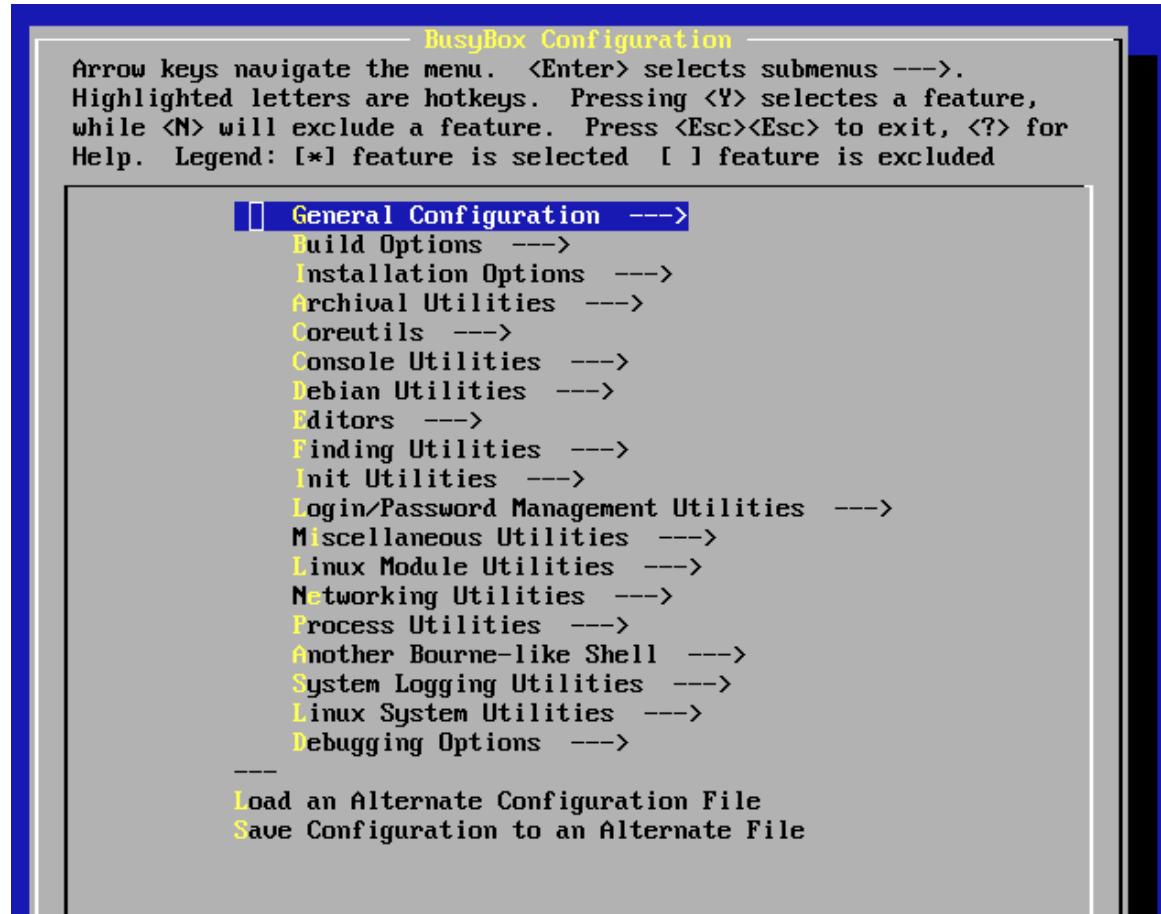

[, [], acpid, add-shell, addgroup, adduser, adjtimex, arp, arping, ash, awk, base64, basename, beep, blkid, blockdev, bootchartd, brctl, bunzip2, bzip2, cal, cat, catv, chat, chattr, chgrp, chmod, chown, chpasswd, chpst, chroot, chrt, chvt, cksum, clear, cmp, comm, cp, cpio, crond, crontab, cryptpw, cttyhack, cut, date, dc, dd, deallocvt, delgroup, deluser, depmod, devmem, df, dhcprelay, diff, dirname, dmesg, dnsd, dnsdomainname, dos2unix, du, dumpkmap, dumpleases, echo, ed, egrep, eject, env, envdir, envuidgid, ether-wake, expand, expr, fakeidentd, false, fbset, fbsplash, fdflush, fdformat, fdisk, fgconsole, fgrep, find, findfs, flock, fold, free, freeramdisk, fsck, fsck.minix, fsync, ftpd, ftpget, ftpput, fuser, getopt, getty, grep, gunzip, gzip, halt, hd, hdparm, head, hexdump, hostid, hostname, httpd, hush, hwclock, id, ifconfig, ifdown, ifenslave, ifplugged, ifup, inetd, init, insmod, install, ionice, iostat, ip, ipaddr, ipcalc, ipcrm, ipcs, iplink, iproute, iprule, iptunnel, kbd_mode, kill, killall, killall5, klogd, last, length, less, linux32, linux64, linuxrc, ln, loadfont, loadkmap, logger, login, logname, logread, losetup, lpd, lpq, lpr, ls, lsattr, lsmod, lspci, lsusb, lzcat, lzma, lzop, lzopcat, makedevs, makemime, man, md5sum, mdev, mesg, microcom, mkdir, mkdosfs, mke2fs, mkfifo, mkfs.ext2, mkfs.minix, mkfs.vfat, mknod, mkpasswd, mkswap, mktemp, modinfo, modprobe, more, mount, mountpoint, mpstat, mt, mv, nameif, nbd-client, nc, netstat, nice, nmeter, nohup, nslookup, ntpd, od, openvt, passwd, patch, pgrep, pidof, ping, ping6, pipe_progress, pivot_root, pkill, pmap, popmaildir, poweroff, powertop, printenv, printf, ps, pscan, pwd, raidautorun, rdate, rdev, readahead, readlink, readprofile, realpath, reboot, reformime, remove-shell, renice, reset, resize, rev, rm, rmdir, rmmmod, route, rpm, rpm2cpio, rtcwake, run-parts, runlevel, runsv, runsvdir, rx, script, scriptreplay, sed, sendmail, seq, setarch, setconsole, setfont, setkeycodes, setlogcons, setsid, setuidgid, sh, sha1sum, sha256sum, sha512sum, showkey, slattach, sleep, smemcap, softlimit, sort, split, start-stop-daemon, stat, strings, stty, su, slogin, sum, sv, svlogd, swapoff, swapon, switch_root, sync, sysctl, syslogd, tac, tail, tar, tcpsvd, tee, telnet, telnethd, test, tftp, tftpd, time, timeout, top, touch, tr, traceroute, traceroute6, true, tty, ttysize, tunctl, udhcpc, udhcpd, udpsvd, umount, uname, unexpand, uniq, unix2dos, unlzma, unlzop, unxz, unzip, uptime, usleep, uudecode, uuencode, vconfig, vi, vlock, volname, wall, watch, watchdog, wc, wget, which, who, whoami, xargs, xz, xzcat, yes, zcat, zcip]

- Download BusyBox (1.18.3) to your \${PRJROOT}/sysapps directory and extract it there.
- Move to the directory for the rest of the setup:

```
$ cd ${PRJROOT}/sysapps/busybox-1.18.3
```

- Configuration of BusyBox's options:

```
$ make menuconfig
```

- “Busybox Settings”:
 - “Build Options” -> Cross-compiler prefix:
 \${TARGET} -
 - “Installation Options” -> Installation prefix:
 \${PRJROOT} /rootfs
- Build:

```
$ make
```
- Install:

```
$ make install
```

- Only one binary has been installed: /bin/busybox
- All commands are symbolic links to /bin/busybox
- Determining the command issued done through main's argv[] and argc.
- Creating arbitrary links doesn't work
- BusyBox can be told to create hard-links
- Full command doc on web and in package
- Customizing the paths for the various shells:

```
# Set path  
PATH=/bin:/sbin:/usr/bin:/usr/sbin  
export PATH
```

10. Auto-generating FSes/distros

- Yocto
- Buildroot
- PTXdist
- OpenWRT
- LTIB
- OpenEmbedded
- Gentoo

11. Creating a cross-dev toolchain

- **crosstool-ng**: successor to crosstool
- Available at:
 - http://ymorin.is-a-geek.org/projects/crosstool
- Downloads, patches, builds, installs, etc.
- Comprises **23** steps
- Menuconfig-based
- Supports uClibc, glibc and eglibc
- Supports ARM, Blackfin, MIPS, PowerPC, SH, ...
- Fairly well maintained

- Must make sure the following are installed on Ubuntu in order to use crosstool-ng:
 - gawk
 - texinfo
 - automake
 - libtool
 - cvs
 - libncurses5-dev
- Use “sudo apt-get install” to get those

- Download and extract to \${PRJROOT}/build-tools
- Configure crosstool:

```
$ cd crosstool-ng-1.10.0/  
$ ./configure
```

- Build and install crosstool-ng:

```
$ make  
$ make install
```

- Configure crosstool:

```
$ cd ${PRJROOT}/build-tools  
$ ct-ng menuconfig
```

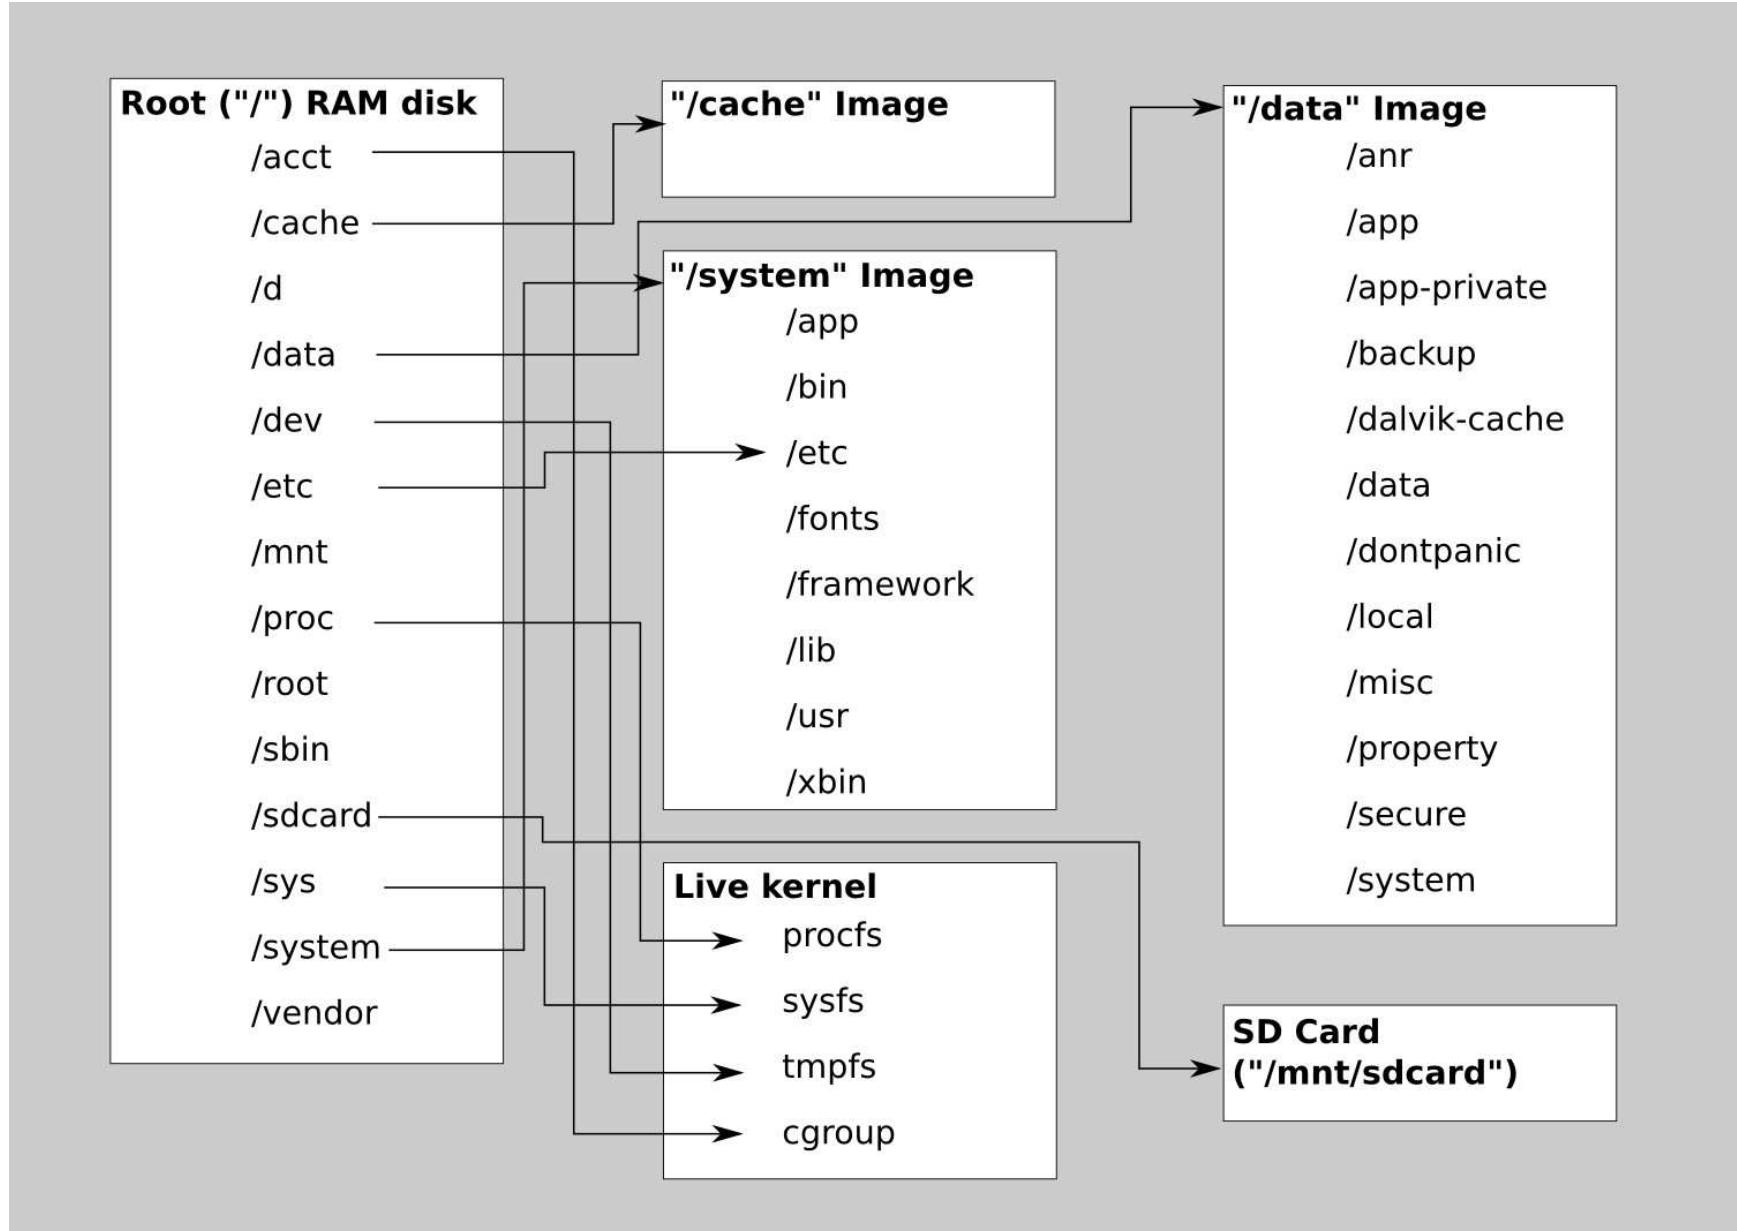

- Options:
 - Paths->Prefix directory: \${PREFIX}/\${CT_TARGET}

Native Android User-Space

1. Filesystem layout
2. Architecture vs. filesystem
3. Build system and filesystem
4. adb
5. Command line
6. Init
7. ueventd
8. Boot logo
9. Bionic
10. Tiny Android

1. Filesystem layout

1.1. Root directory

- /acct => Control Group mount point (Documentation/cgroups.txt)
- /cache => cache flash partition
- /d => Symlink to /sys/kernel/debug
- /data => Android's "/data" filesystem
- /dev => Device nodes
- /etc => Symlink to /system/etc
- /mnt => Temporary mount point
- /proc => procfs
- /root => unused
- /sbin => eventd and adbd
- /sdcard => SD card mountpoint
- /sys => sysfs
- /system => Android's "/system" filesystem
- /vendor => Symlink to /system/vendor

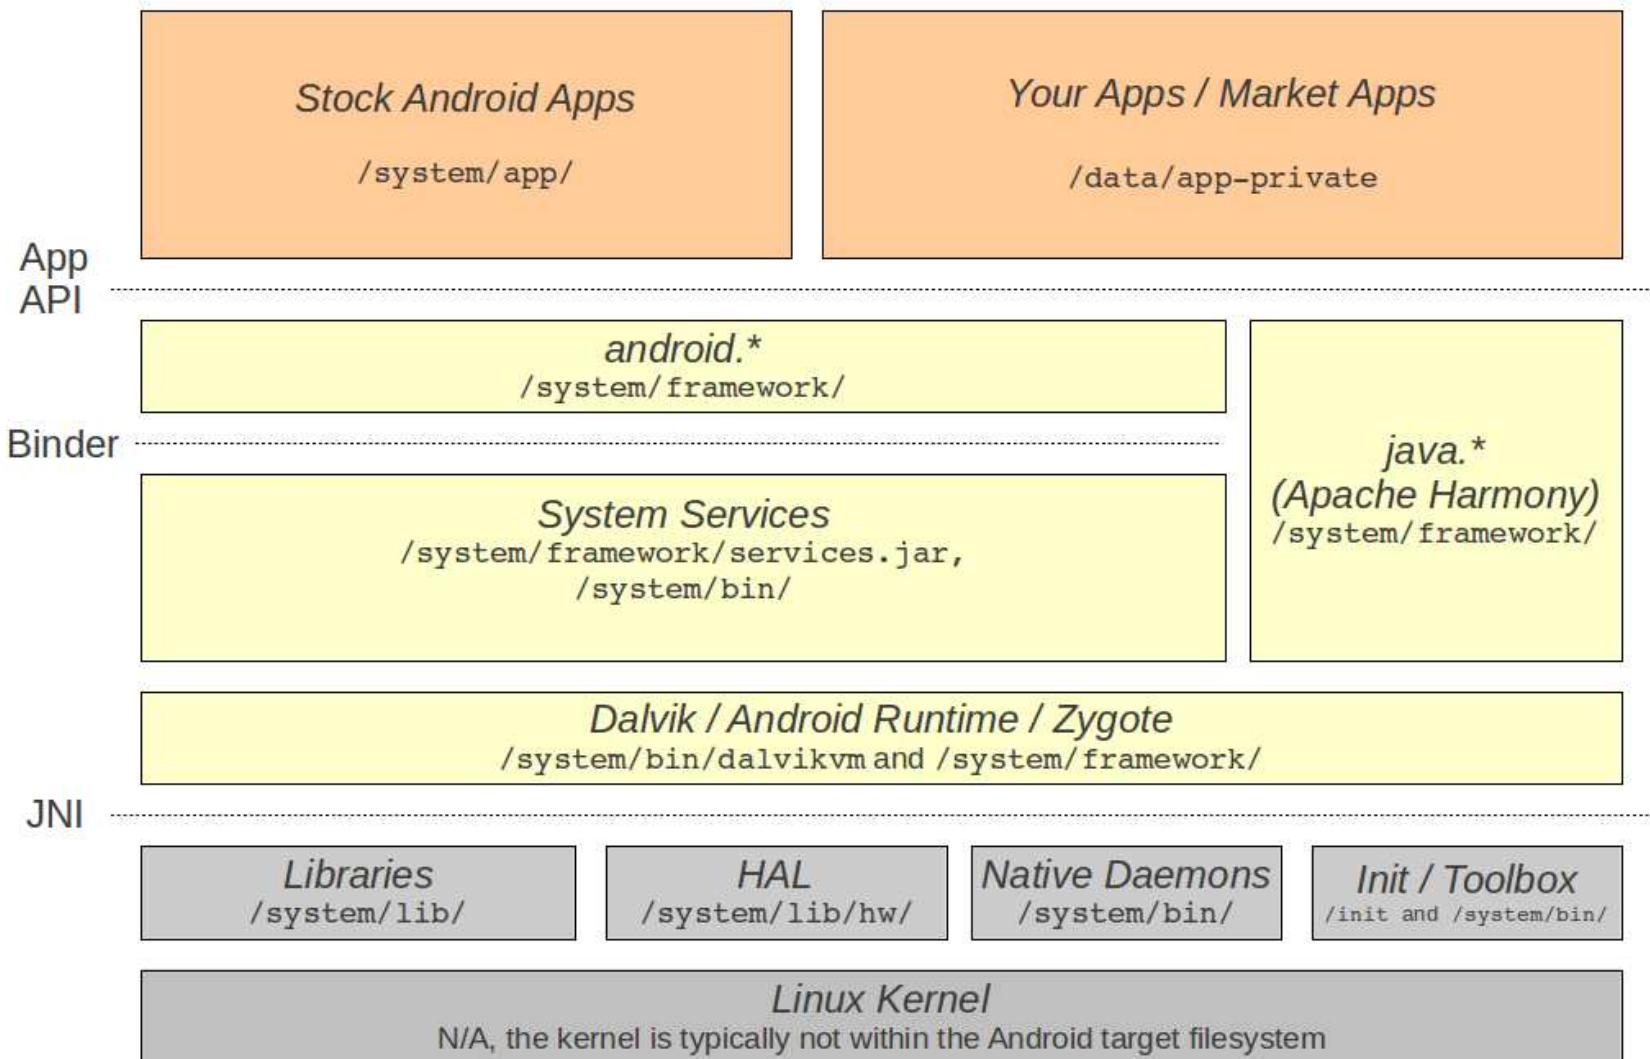

1.1. /system

- /app => Stock apps installed
- /bin => Native binaries and daemons
- /etc => Configuration files
- /fonts => TTFs
- /framework => Android framework .jar files
- /lib => Native libraries
- /usr => Miniature “/usr”
- /xbin => Optional/Extra binaries

1.2. /data

- /anr => ANR traces
- /app => App install location
- /app-private => Protected apps
- /backup => For Backup Manager
- /dalvik-cache => Dalvik DEX cache
- /data => App data
- /dontpanic => Last panic output (console + threads) for “dumpstate”
- /local => Shell-writable space
- /misc => Misc. data (wifi, vpn, bluetooth, ...)
- /property => Persistent system properties (country, lang., ...)
- /secure => Secure Android data available
- /system => System data

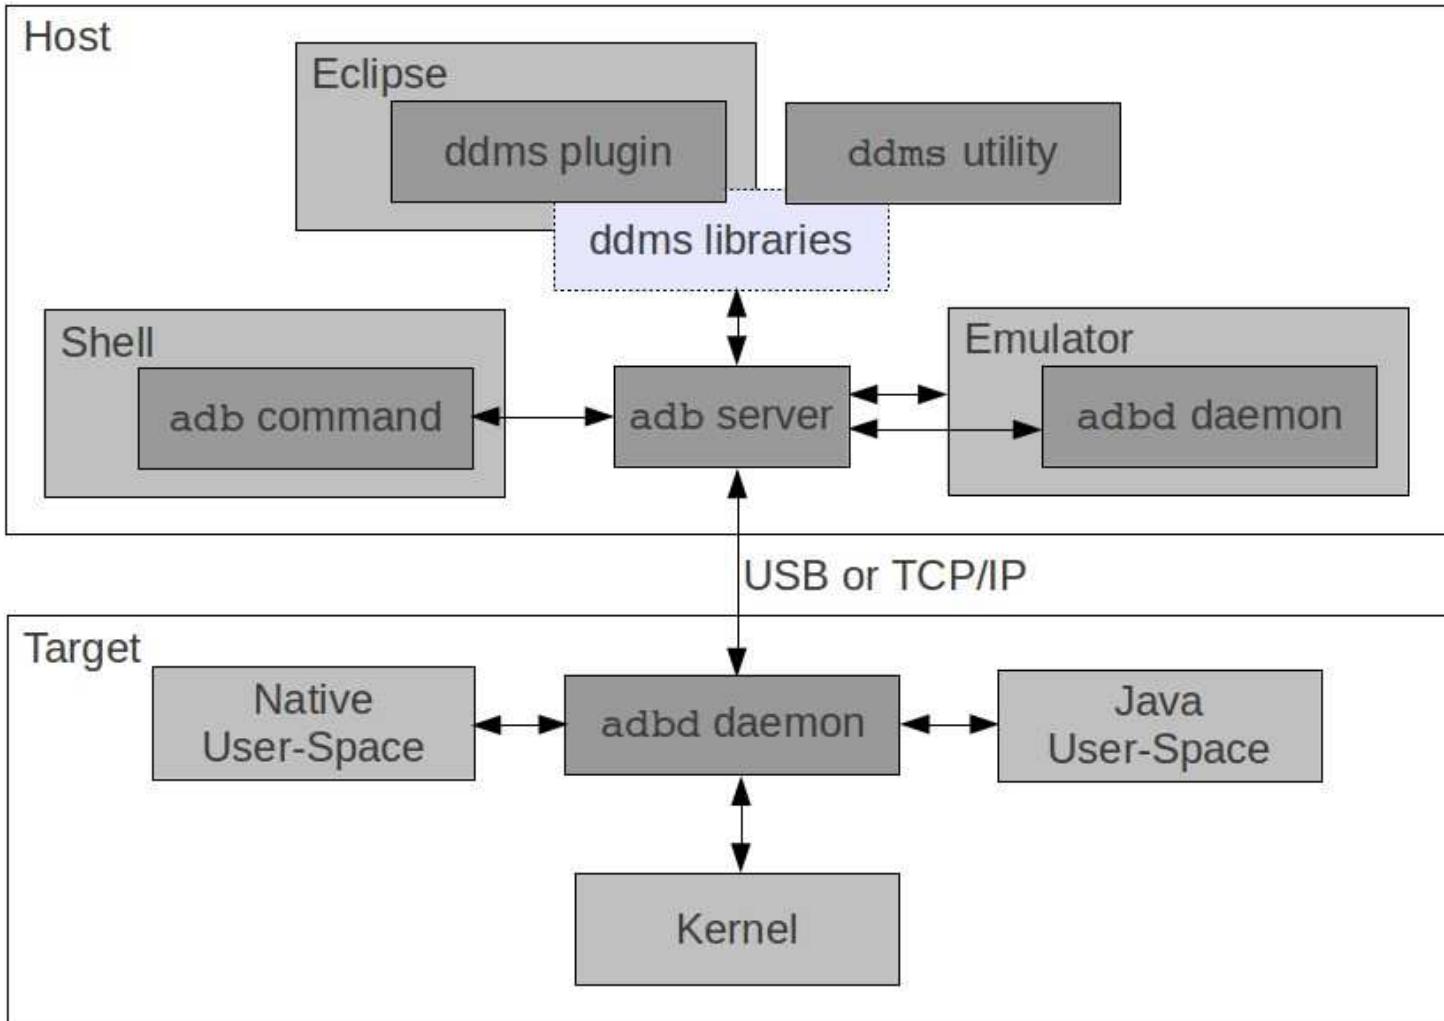

2. Architecture vs. filesystem

3. Build system and filesystem

- Build templates
 - `BUILD_EXECUTABLE` = `/system/bin`
 - `BUILD_SHARED_LIBRARY` = `/system/lib`
 - `BUILD_PACKAGE` = `/system/app`
- Default rights and ownership
 - `system/core/include/private/android_filesystem_config.h`
 - User IDs / names
 - `android_dirs` struct
 - `android_files` struct

4. adb

4.1. What adb can do

- See online help for full details
- Managing device connections
- Remote commands:
 - shell
 - log dumping
 - bug reports
 - port forwarding
 - dalvik debugging

- Filesystem commands
 - push
 - pull
 - sync
 - install / uninstall
- State-altering commands
 - reboot
 - run as root
 - switching connection type
 - controlling the emulator
- Tunneling PPP

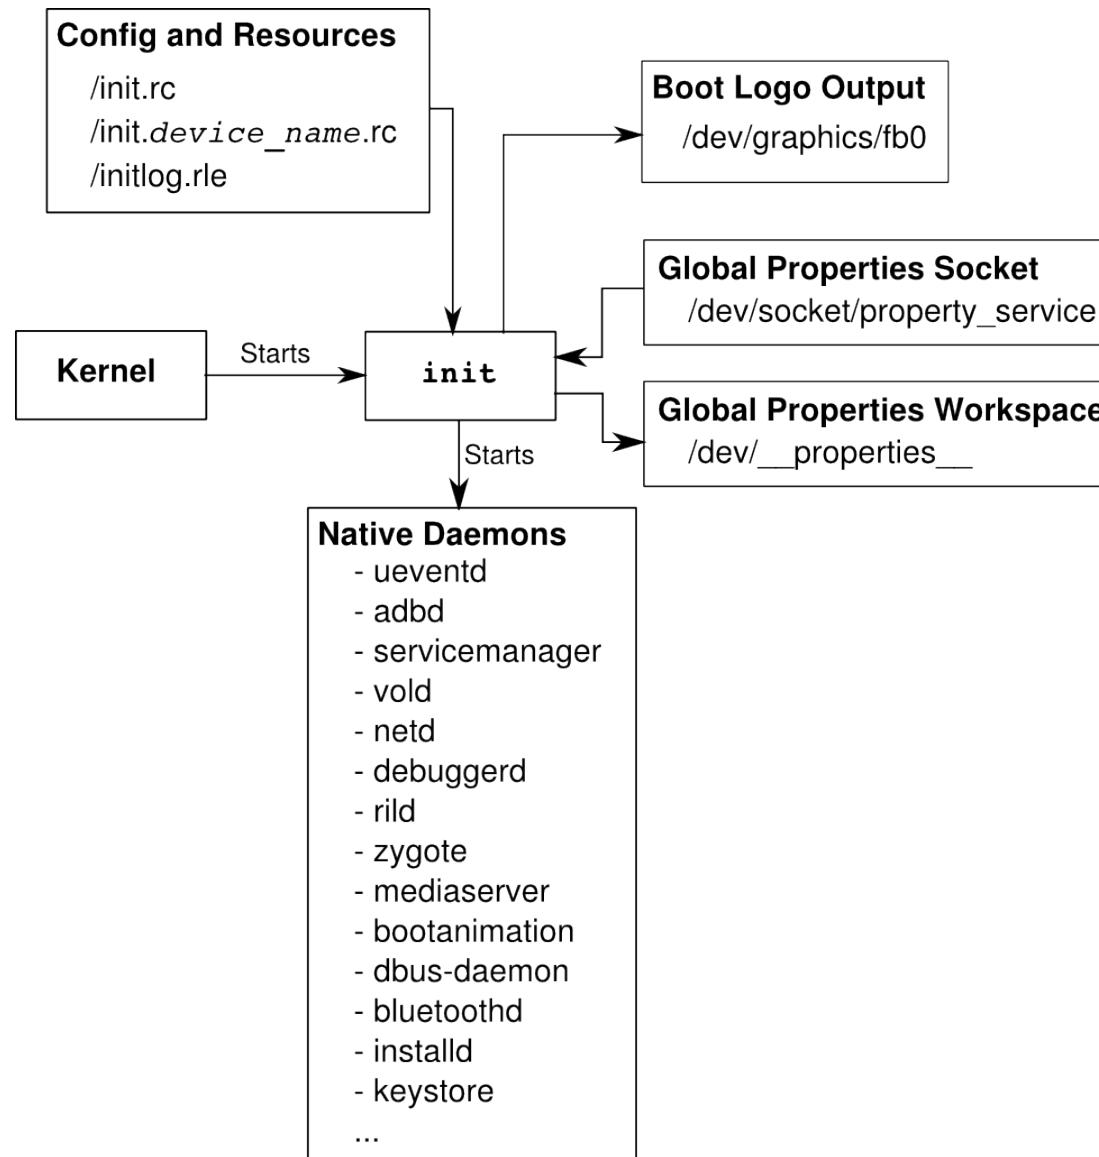

5. Command line

- Shell:
 - NetBSD shell up to 2.3/GB
 - MirBSD Korn shell since 4.0/ICS
- Toolbox:
 - Traditional Linux commands
 - Global properties
 - Input events
 - Services control
 - Logging
 - ioctl
 - Device wiping
 - etc.

- In aosp:
 - /system/core/toolbox
- In filesystem:
 - /system/bin/toolbox
- Provides
 - alarm date getevent insmod ls mv powerd renice schedtop
 - smd top dd getprop ioctl lsmod nandread printenv rm
 - sendevent start umount cat hd ionice lsof netstat ps rmdir
 - setconsole stop uptime chmod df id kill mkdir newfs_msdos r
 - rmmod setkey sync vmstat chown dmesg ifconfig ln ready
 - rotatefb setprop sysen watchprops cmp exists iftop log mount
 - notify reboot route sleep wipe

- logcat
- netcfg
- debuggerd

6. Init

6.1. Config files

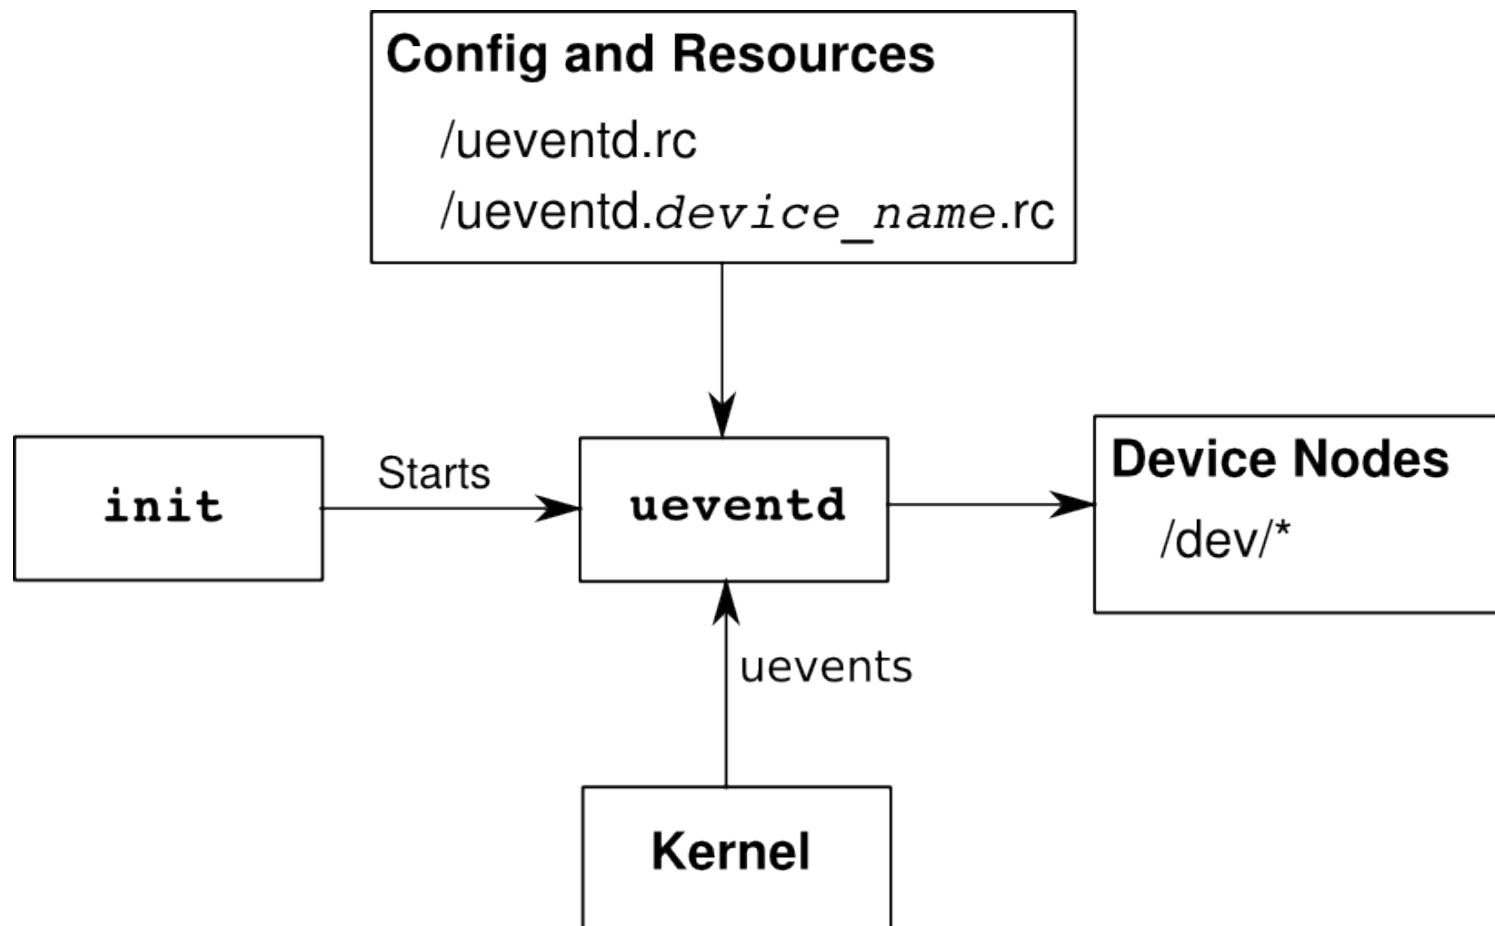

- Location:
 - /init.rc
 - /init.[board].rc
- Semantics:
 - actions
 - Property triggers
 - Commands
 - services (not related to system services or apps)
 - Parameters

6.2. Global properties

- /dev/socket/property_service
- /dev/__properties__
- foo.bar.property
- ro.*
- persist.* => /data/property
- ctl.*
- net.change

- Std files:
 - /system/build.prop
 - /default.prop
- Other files:
 - /system/default.prop
 - /data/local.prop
- Code:
 - `property_get("dalvik.vm.heapsize", heapsizeOptsBuf+4, "16m");`

7. ueventd

7.1. /ueventd.rc

/dev/null 0666 root root

/dev/zero 0666 root root

/dev/full 0666 root root

/dev/ptmx 0666 root root

/dev/tty 0666 root root

8. Boot logo

```
$ cd device/acme/coyotepad  
$ convert -depth 8 acmelogo.png rgb:acmelogos.raw  
$ rgb2565 -rle < acmelogos.raw > acmelogos.rle
```

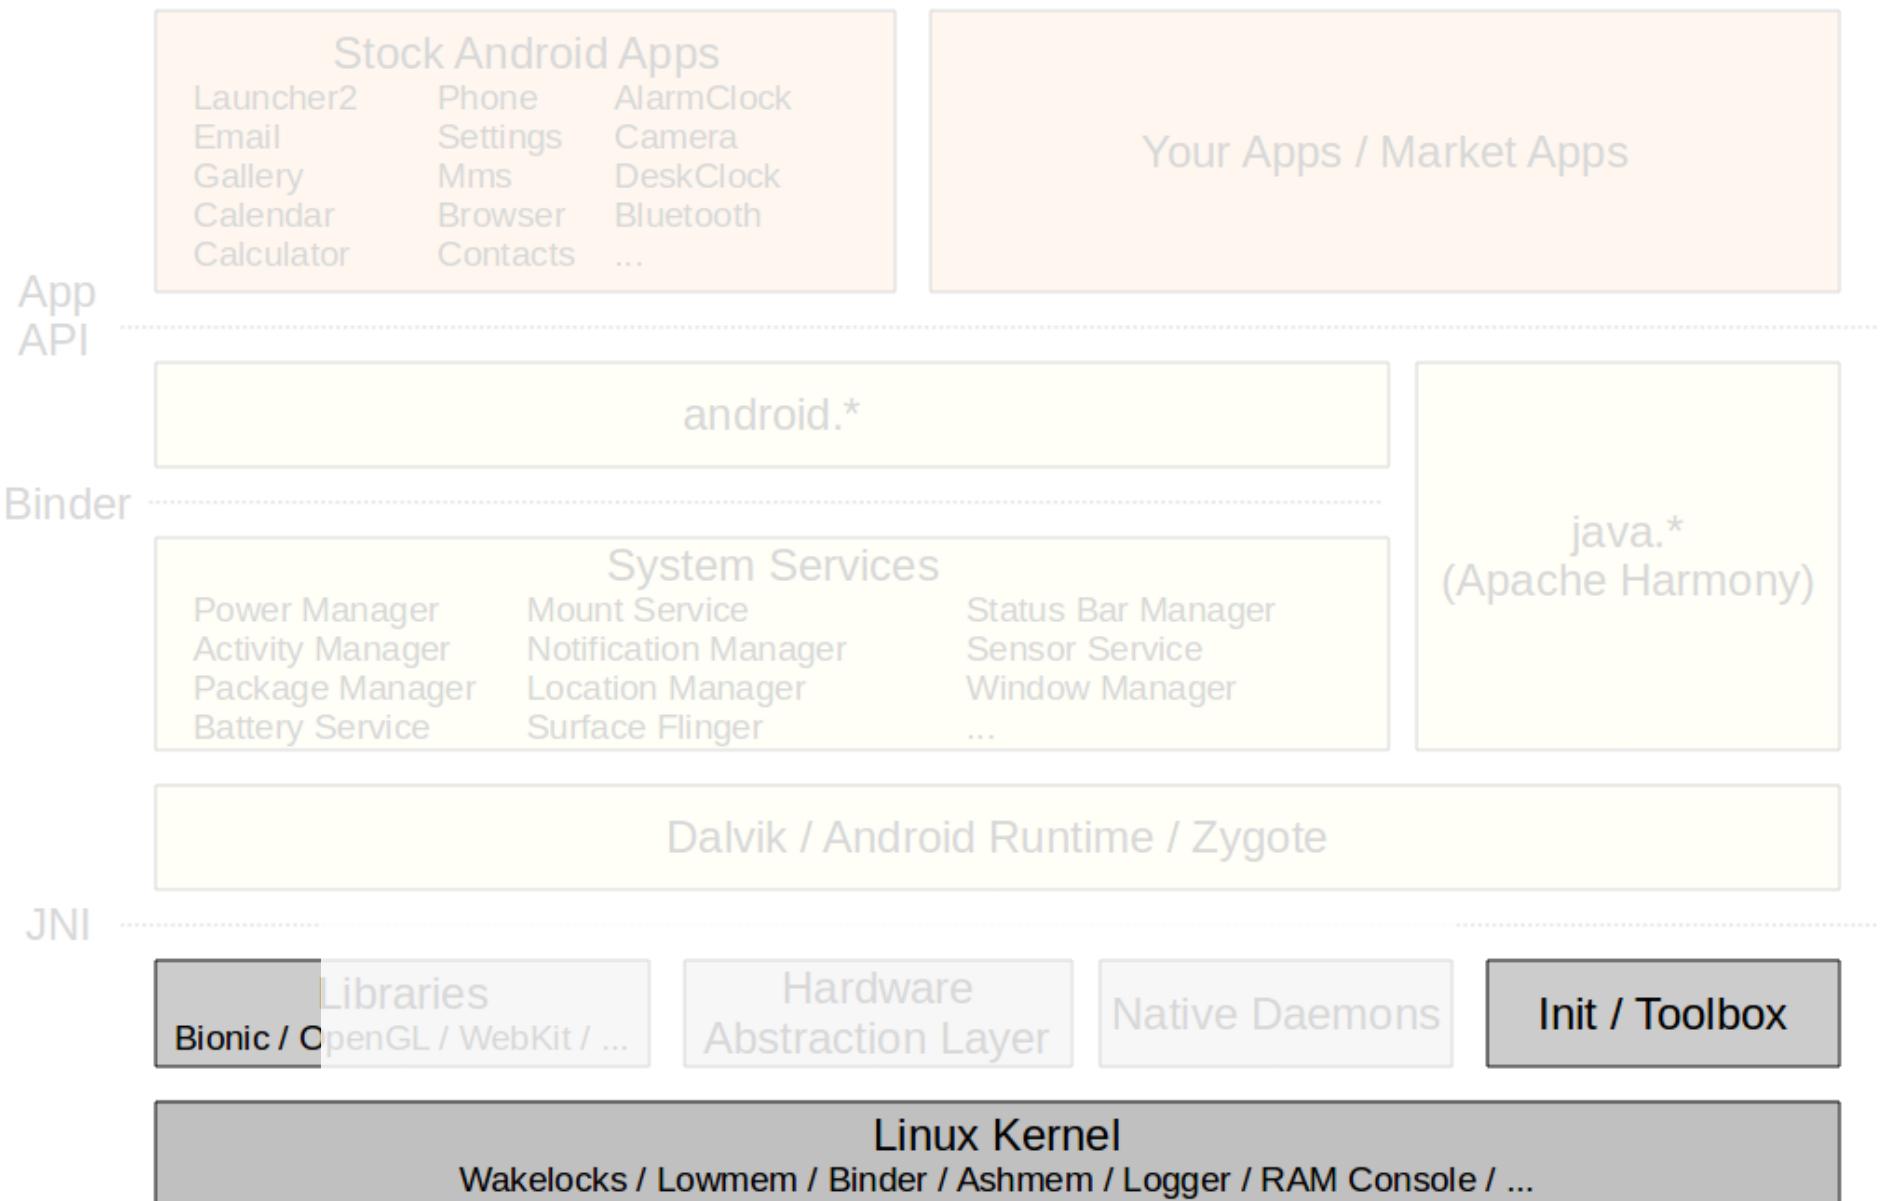

9. Bionic

- In aosp:
 - /bionic
- In filesystem:
 - /system/lib
- Provides:
 - libc
 - libm
 - libdl
 - libstd++
 - libthread_db
 - linker

10. Tiny Android

```
$ BUILD_TINY_ANDROID=true make -j4
```

- 3MB filesystem
- Minimal root fs
- init
- toolbox + shell
- adb
- bionic + utility libs
- No “system/framework/”
- No “system/app”

System Services and Framework Internals

1. Kickstarting the Framework
2. Utilities and Commands
3. Native Daemons
4. System Services Internals
5. Hardware Abstraction Layer
6. Android Framework

1. Kickstarting the Framework

- Core building blocks
- System services
- Boot animation
- Dex optimization
- Apps startup

1.1. Core building blocks

- Service manager
- Dalvik
- Android runtime
- Zygote

1.2. System services

System Services

System Server

Java-built Services

Power Manager Mount Service
Activity Manager Notification Manager
Package Manager Location Manager
Battery Service Search Service
Window Manager Wallpaper Service
Status Bar Headset Observer
Clipboard Service ...

C-built Services

Sensor Service

Surface Flinger

Media Service

Audio Flinger
Media Player Service
Camera Service
Audio Policy Service

Phone App

JNI

Native Methods for
Java-built Services

Hardware Abstraction Layer

1.3. Boot animation

- Default boot animation
- bootanimation.zip
- setprop debug.sf.nobootanimation 1

1.4. Dex optimization

- Files:
 - .jar
 - .apk
- Directories:
 - BOOTCLASSPATH
 - /system/etc/permission/platform.xml
 - /system/framework
 - /system/app
 - /vendor/app
 - /data/app
 - /data/app-private

1.5. Apps startup

- Input methods
- Persistent apps
- Home screen
- **BOOT_COMPLETED** intent
- **APPWIDGET_UPDATE** intent

2. Utilities and Commands

- General-purpose commands
 - service
 - dumpsys
 - dumpstate
 - rawbu
- Service-specific utilities
 - am
 - pm
 - svc

- ime
- input
- monkey
- bmgr
- stagefright
- Dalvik utilities
 - dalvikvm
 - dvz
 - dexdump

3. Native daemons

- servicemanager
- installd
- vold
- netd
- rild
- keystore

3.1. servicemanager

- In aosp:
 - /frameworks/base/cmds/servicemanager/
- In filesystem:
 - /system/bin/
- Provides:
 - Context management for binder
 - Service index for entire system

3.2. installd

- In aosp:
 - /frameworks/base/cmds/installd
- In filesystem:
 - /system/bin/
- Provides:
 - Package install/uninstall
 - Sanity checks and verifications
 - Interfaces with Package Manager service

3.3. vold

- In aosp:
 - /system/vold/
- In filesystem:
 - /system/bin/
- Provides:
 - Volume mounter
 - Auto-mount
 - Auto-format mounted devices

3.4. netd

- In aosp:
 - /system/netd/
- In filesystem:
 - /system/bin/
- Provides:
 - Management of aspects of networking
 - Interfaces with Network Management service

3.5. rild

- In aosp:
 - /hardware/ril/mock-ril/
- In filesystem:
 - /system/bin/
- Provides:
 - “Radio Interface Layer” to phone hardware

3.6. keystore

- In aosp:
 - frameworks/base/cmds/keystore/
- In filesystem:
 - /system/bin
- Provides:
 - Store key-value pairs
 - Security keys for connecting to network infrastructure

4. System Services Internals

- Services run by System Server
- Observing the System Server
- Calling on system services
- Inside a few system services
- Creating your own system service

4.1. Services run by the System Server

Entropy Service	Device Policy	Audio Service
Power Manager	Status Bar	Headset Observer
Activity Manager	Clipboard Service	Dock Observer
Telephone Registry	Input Method Service	UI Mode Manager Service
Package Manager	NetStat Service	Backup Service
Account Manager	NetworkManagement Service	AppWidget Service
Content Manager	Connectivity Service	Recognition Service
System Content Providers	Throttle Service	<i>Status Bar Icons</i>
Battery Service	Accessibility Manager	DiskStats Service
Lights Service	Mount Service	ADB Settings Observer
Vibrator Service	Notification Manager	
Alarm Manager	Device Storage Monitor	
Init Watchdog	Location Manager	
Sensor Service	Search Service	
Window Manager	DropBox Service	
Bluetooth Service	Wallpaper Service	

4.1.1. Some stats

- frameworks/base/services/java/com/android/server:
 - 3.5 M
 - ~100 files
 - 85 kloc
- Activity manager:
 - 920K
 - 30+ files
 - 20 kloc

4.2. Observing the System Server

- Logcat
- dumpsys

4.2.1. logcat

- Find the System Server's PID

```
$ adb shell ps | grep system_server  
system 63 32 120160 35408 ffffffff afd0c738 S system_server
```

- Look for its output:

```
$ adb logcat | grep "63"
```

```
...  
D/PowerManagerService( 63): bootCompleted  
I/TelephonyRegistry( 63): notifyServiceState: 0 home Android Android 310260 UMTS CSS not supp...  
I/TelephonyRegistry( 63): notifyDataConnection: state=0 isDataConnectivityPossible=false reason=null  
interfaceName=null networkType=3

I/RecoverySystem( 63): No recovery log file  
W/WindowManager( 63): App freeze timeout expired.  
...
```

4.2.2. dumpsys

Currently running services:

SurfaceFlinger

accessibility

account

activity

alarm

appwidget

audio

backup

...

wifi

window

DUMP OF SERVICE SurfaceFlinger:

+ Layer 0x396b90

 z= 21000, pos=(0, 0), size=(480, 800), needsBlending=1, needsDithering=1, invalidat ...

0]

 name=com.android.launcher/com.android.launcher2.Launcher

 client=0x391e48, identity=6

 [head= 1, available= 2, queued= 0] reallocMask=00000000, inUse=-1, identity=6, status=0

 format= 1, [480x800:480] [480x800:480], freezeLock=0x0, dq-q-time=53756 us

...

4.3. Calling on System Services

- Use getSystemService
- Ex: NotificationManager Object reference:

```
String ns = Context.NOTIFICATION_SERVICE;
```

```
NotificationManager mNotificationManager = (NotificationManager) \\\ngetSystemService(ns);
```

- Prepare your content
- Call on the object:

```
mNotificationManager.notify(HELLO_ID, notification);
```

4.4. Inside a few System Services

- Get the AOSP ... repo, etc.
- Tricks:
 - Import into Eclipse and collapse methods
 - Use reverse-engineering tools:
 - Imagix
 - Rationale
 - Lattix
 - Scitools
 - ...
- Be patient, this isn't documented anywhere ...

4.4.1. ActivityManager

- Start new Activities, Services
- Fetch Content Providers
- Intent broadcasting
- OOM adj. maintenance
- Application Not Responding
- Permissions
- Task management
- Lifecycle management

- Ex. starting new app from Launcher:
 - onClick(Launcher)
 - startActivityForResult(Activity.java)
 - <*Binder*>
 - ActivityManagerService
 - startViaZygote(Process.java)
 - <*Socket*>
 - Zygote

4.4.2. Package Manager

- 10 kloc
- 450 K
- Installation / removal
- Permissions
- Intent resolution (also IntentResolver.java)
- Called by Activity Manager

4.4.3. Window Manager

- Main thread
- Window manipulation
- Wallpaper handling
- Orientation
- Focus
- Layering
- Input event management

4.4.4. Notification Manager

- Toasts
- Notifications
- Sound playback (see `NotificationPlayer.java`)

4.4.5. Power Manager

- Wakelocks
- Sleep
- Brightness
- Lock

4.4.6. Network Management Service

- Talks to “netd” /system/netd
- Interface configuration
- Tethering
- DNS

4.4.7. Mount Service

- Mount / Unmount
- Format
- USB mass storage
- OBB

4.4.8. Location Manager

- Manage location providers
- `getBestProvider()`
- Proximity alerts
- Last known location

4.4.9. Status Bar Manager

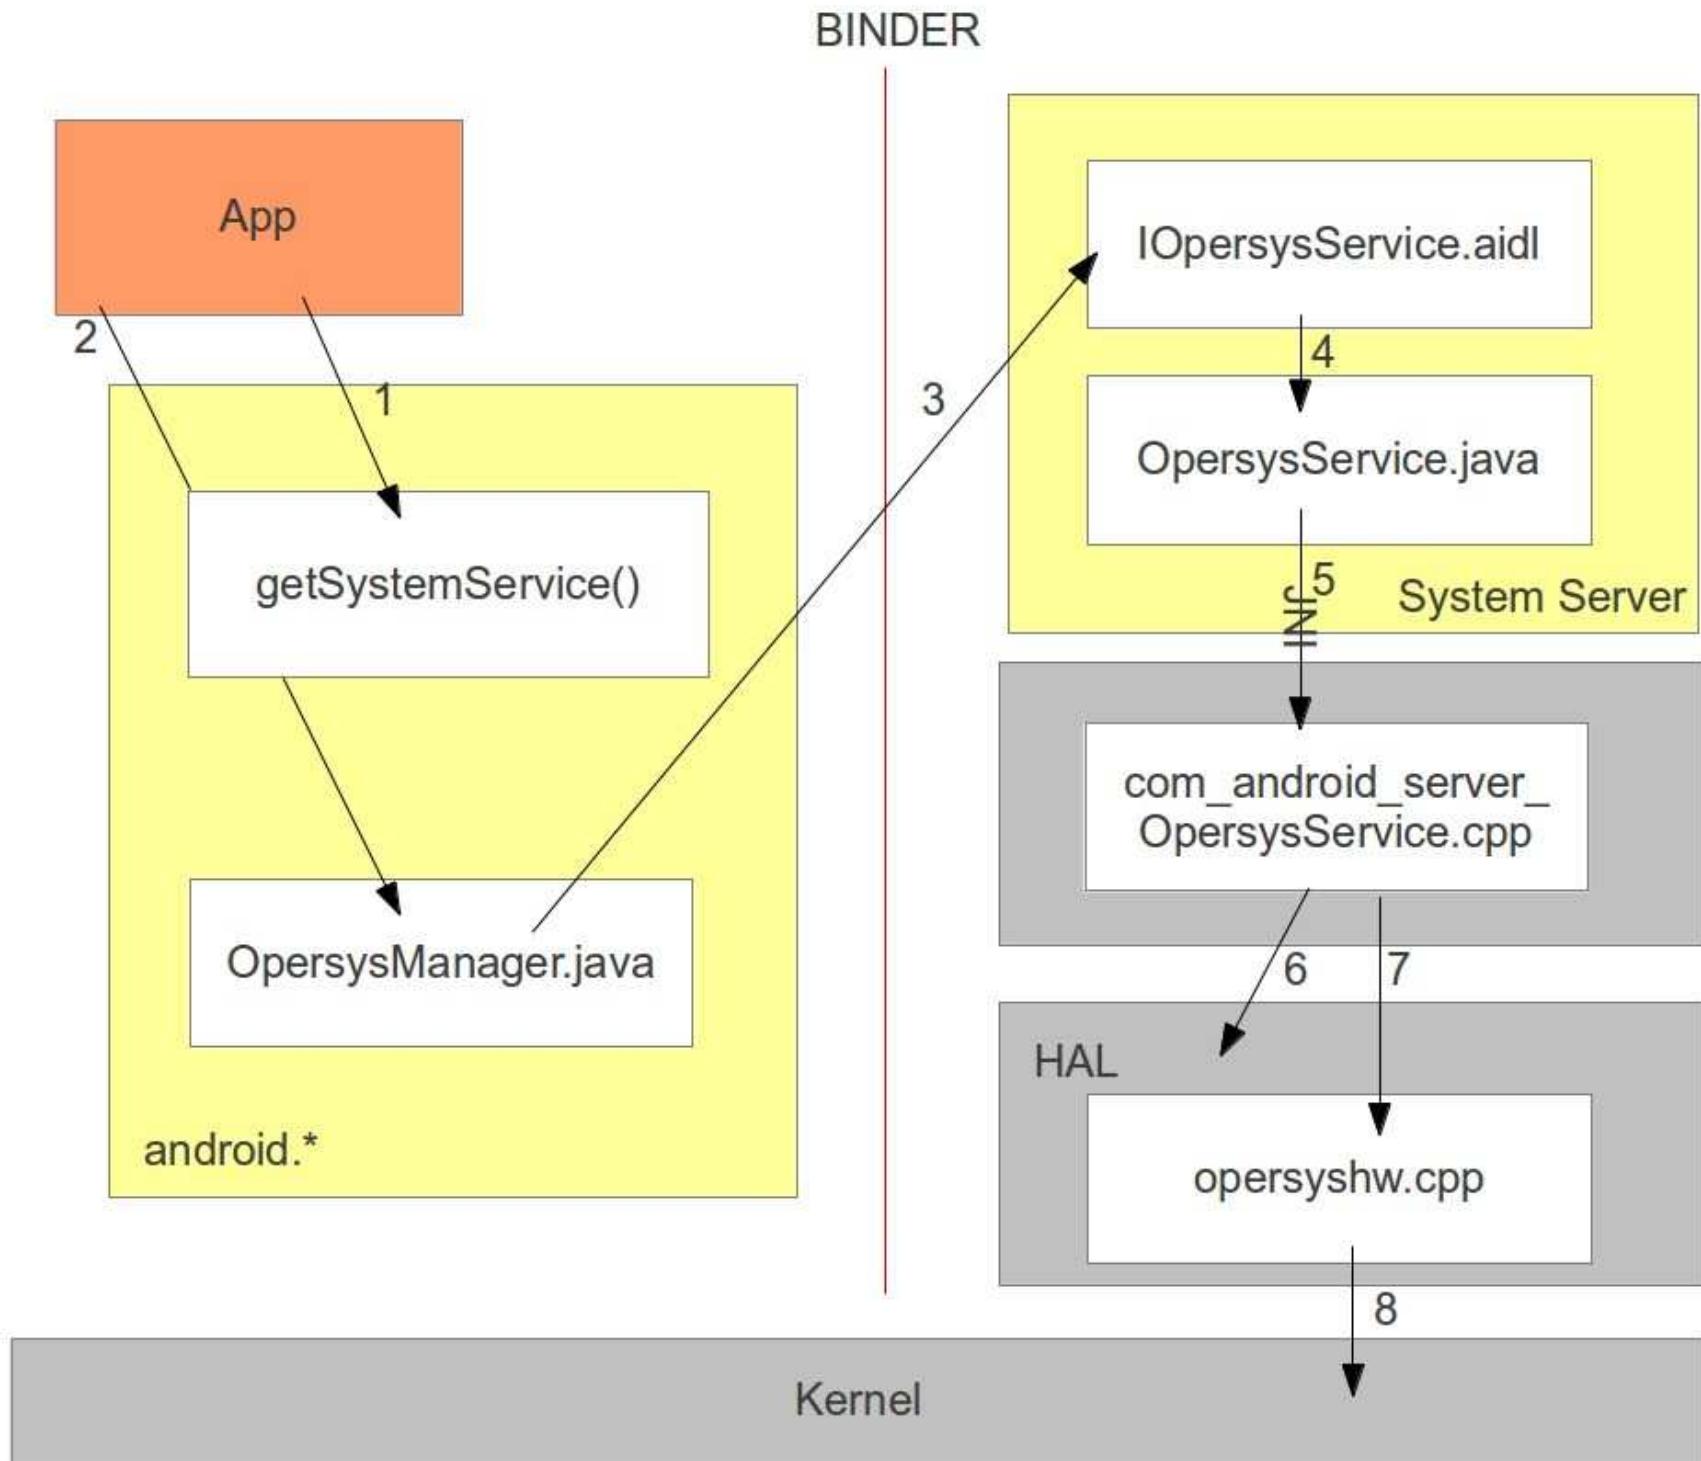

- Expand / collapse
- Icon visibility
- Reveal callbacks
- Callbacks for notification manager

4.4.10. Backup Manager

- Enable / disable
- Transport management
- backupNow()
- ...

4.5. Creating your own System Service

- Add your code to:
frameworks/base/services/java/com/android/server/
- Have the SystemServer.java init+reg. your service
- Define hardware API for apps
- Expose through:
 - frameworks/base/core/java/android/os/[server].aidl
- Call on native “driver” code through JNI
- Implement or connect to appropriate driver
- Create an app that calls on service
- May need to create new SDK ...

4.5.1. OpersysService.java

```
package com.android.server;

import android.content.Context;
import android.os.Handler;
import android.os.IOpersysService;
import android.os.Looper;
import android.os.Message;
import android.os.Process;
import android.util.Log;

public class OpersysService extends IOpersysService.Stub {
    private static final String TAG = "OpersysService";
    private OpersysWorkerThread mWorker;
    private OpersysWorkerHandler mHandler;
    private Context mContext;

    public OpersysService(Context context) {
        super();
        mContext = context;
        mWorker = new OpersysWorkerThread("OpersysServiceWorker");
        mWorker.start();
        Log.i(TAG, "Spawned worker thread");
    }

    public void setValue(int val) {
        Log.i(TAG, "setValue " + val);
        Message msg = Message.obtain();
        msg.what = OpersysWorkerHandler.MESSAGE_SET;
        msg.arg1 = val;
        mHandler.sendMessage(msg);
    }
}
```

```

private class OpersysWorkerThread extends Thread{
    public OpersysWorkerThread(String name) {
        super(name);
    }

    public void run() {
        Looper.prepare();
        mHandler = new OpersysWorkerHandler();
        Looper.loop();
    }
}

private class OpersysWorkerHandler extends Handler {
    private static final int MESSAGE_SET = 0;

    @Override
    public void handleMessage(Message msg) {
        try {
            if (msg.what == MESSAGE_SET) {
                Log.i(TAG, "set message received: " + msg.arg1);
            }
        }
        catch (Exception e) {
            // Log, don't crash!
            Log.e(TAG, "Exception in OpersysWorkerHandler.handleMessage:", e);
        }
    }
}

```

4.5.2. IOpersysService.aidl

```
package android.os;
/**  
 * {@hide}  
 */
interface IOpersysService {
    void setValue(int val);
}
```

4.5.3. frameworks/base/Android.mk

...

```
core/java/android/os/IPowerManager.aidl \
core/java/android/os/IOPersysService.aidl \
core/java/android/os/IRemoteCallback.aidl \
...
```

4.5.4. SystemServer.java

Should eventually be Context.OPERSYS_SERVICE

...

```
try {
    Slog.i(TAG, "Opersys Service");
    ServiceManager.addService("opersys", new OpersysService(context));
} catch (Throwable e) {
    Slog.e(TAG, "Failure starting OpersysService Service", e);
}
...
```

4.5.5. HelloServer.java

```
package com.opersys.helloserver;

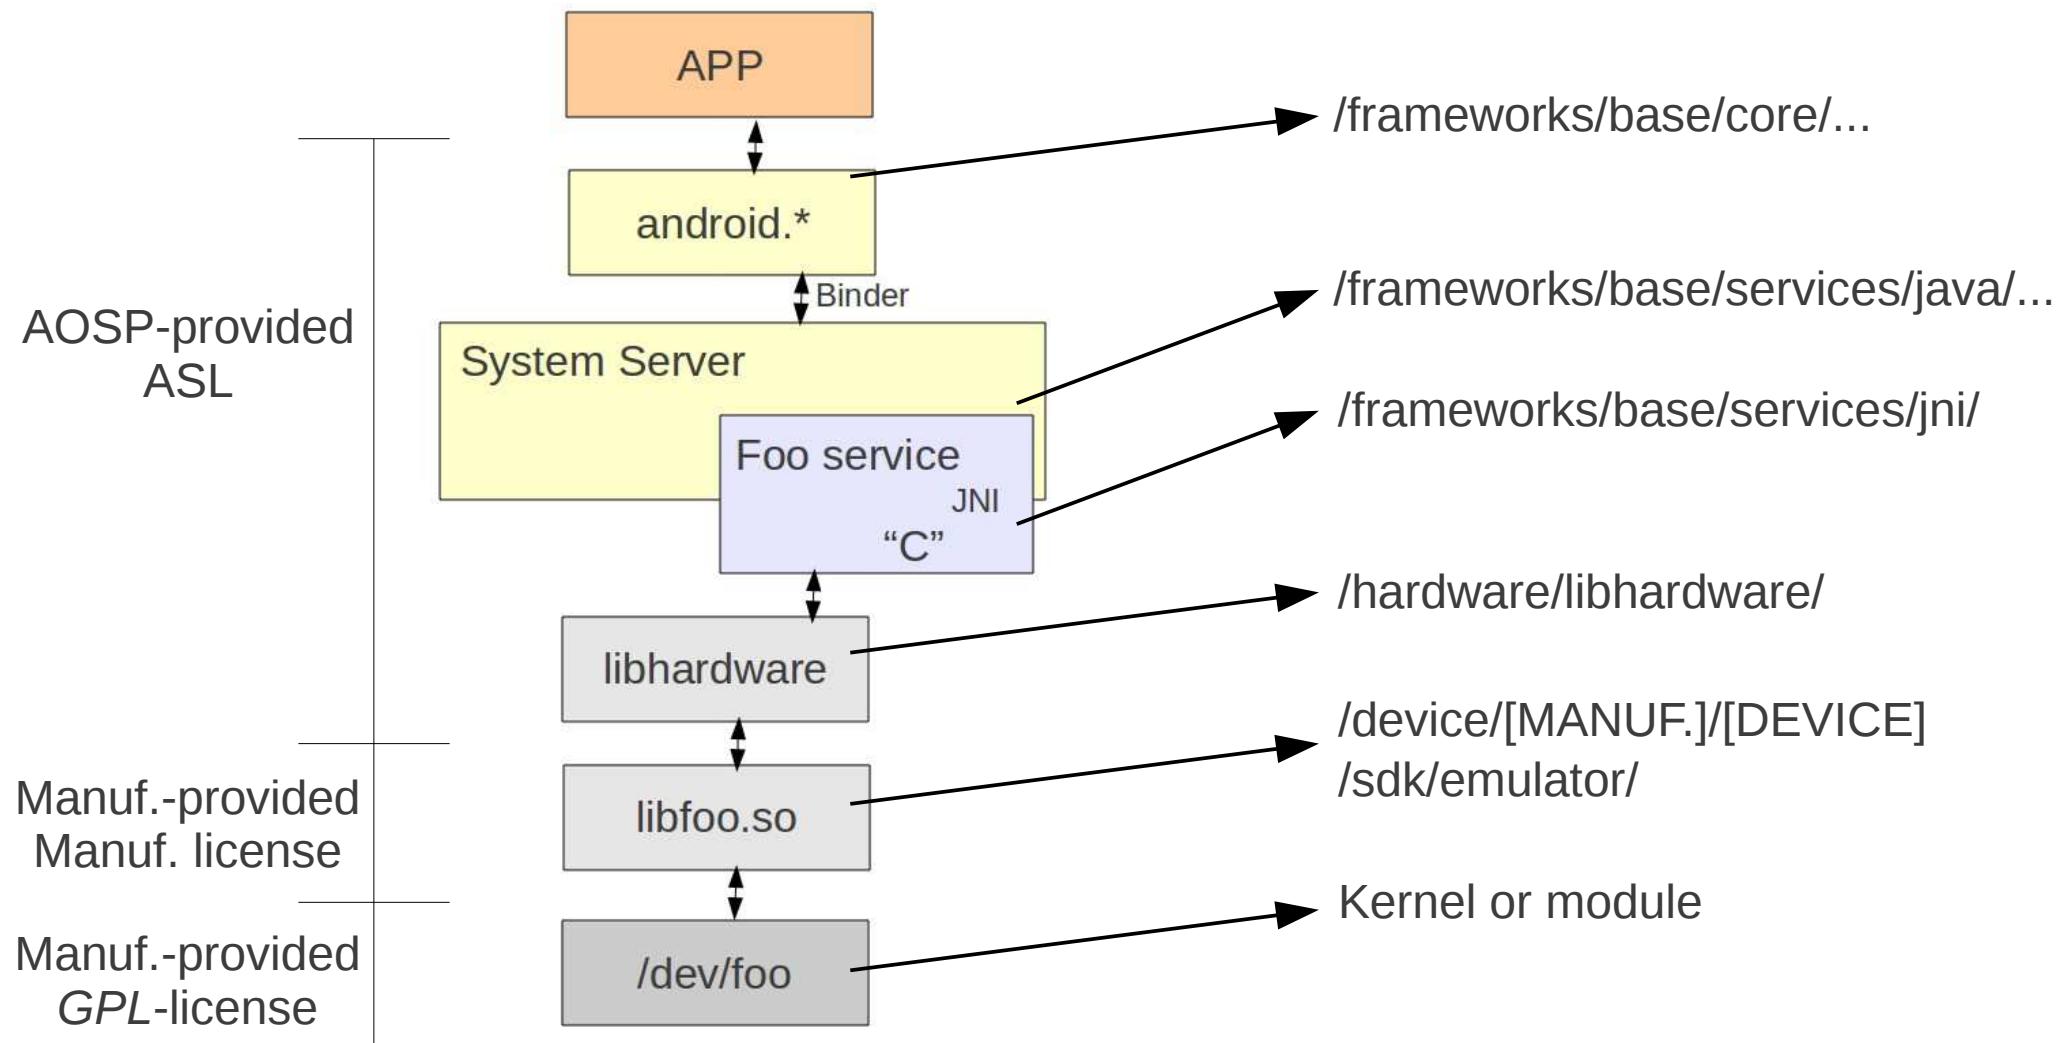

import android.app.Activity;
import android.os.Bundle;
import android.os.ServiceManager;
import android.os.IopersysService;
import android.util.Log;

public class HelloServer extends Activity {
    private static final String DTAG = "HelloServer";

    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.main);

        IopersysService om =
IopersysService.Stub.asInterface(ServiceManager.getService("opersys"));
        try {
            Log.d(DTAG, "Going to call service");
            om.setValue(20);
            Log.d(DTAG, "Service called succesfully");
        }
        catch (Exception e) {
            Log.d(DTAG, "FAILED to call service");
            e.printStackTrace();
        }
    }
}
```

5. Hardware Abstraction Layer

- [aosp]/hardware/libhardware/include/hardware
 - gps.h
 - lights.h
 - sensors.h
- [aosp]/hardware/ril/include/telephony/
 - ril.h
- Examples in [aosp]/device/*/*
- Using JNI to call C functions

6. Android Framework

- Location and components
- android.*
- Customization

6.1. Location and components

- [aosp]/frameworks/base
 - /cmds => native cmd and daemons
 - /core => android.* and com.android.*
 - /data => Fonts and sounds
 - /graphics => 2D & Renderscript
 - /include => "C" includes
 - /keystore => security key store
 - /libs => "C" libraries
 - /location => Location provider
 - /media => Stagefright, codecs, etc.
 - /native => Native code for some frameworks components
 - /obex => Bluetooth obex
 - /opengl => GL library and java code
 - /packages => A few core packages (Status Bar)
 - /services => System server
 - /telephony => Phone related functionality
 - /tools => A few core tools (aapt, aidl, ...)
 - /voip => RTP & SIP interfaces
 - /vpn => VPN functionality
 - /wifi => Wifi manager, monitor, etc.

6.2. android.*

accessibilityservice	content	hardware	pim	speech
accounts	database	inputmethodservice	preference	test
annotation	ddm	net	provider	text
app	debug	nfc	security	util
appwidget	emoji	os	server	view
bluetooth	gesture	service	webkit	widget

6.3. Customization

- Extending API
- Boot screen
- Status bar
- Network
- Preloaded apps
- Browser bookmarks
- Email provider customization
- Themes

6.3.1. Extending API – System service

- frameworks/base/core/java/android/
 - app/ContextImpl.java
 - content/Context.java
 - os/OpersysManager.java

6.3.1.1. - 4.x - app/ContextImpl.java

```
...  
import android.os.IOpersysService;  
import android.os.OopersysManager;  
...  
    registerService(OPERSYS_SERVICE, new ServiceFetcher() {  
        public Object createService(ContextImpl ctx) {  
            IBinder b =  
                ServiceManager.getService(OPERSYS_SERVICE);  
            IOpersysService service =  
                IOpersysService.Stub.asInterface(b);  
            return new OopersysManager(service);  
        }  
    });  
...
```

6.3.1.1. - 2.3.x - app/ContextImpl.java

```
...  
import android.os.IOpersysService;  
import android.os.OopersysManager;  
...  
    private DownloadManager mDownloadManager = null;  
    private NfcManager mNfcManager = null;  
    private OopersysManager mopersysManager = null;  
...  
        return getDownloadManager();  
    } else if (NFC_SERVICE.equals(name)) {  
        return getNfcManager();  
    } else if (OPERSYS_SERVICE.equals(name)) {  
        return getopersysManager();  
    }  
...  
...
```

```
private OpersysManager getOpersysManager() {  
    synchronized (mSync) {  
        if (mOpersysManager == null) {  
            IBinder b = ServiceManager.getService(OPERSYS_SERVICE);  
            IOpersysService service = IOpersysService.Stub.asInterface(b);  
            mOpersysManager = new OpersysManager(service);  
        }  
    }  
    return mOpersysManager;  
}
```

6.3.1.2. content/Context.java

```
...  
  
    /**  
     * Use with {@link #getSystemService} to retrieve a  
     * {@link android.nfc.NfcManager} for using NFC.  
     *  
     * @see #getSystemService  
     */  
  
    public static final String NFC_SERVICE = "nfc";  
  
    /** The Opersys service **/  
    public static final String OPERSYS_SERVICE = "opersys";  
...  
...
```

6.3.1.3. os/OopersysManager.java

```
package android.os;

import android.os.IopersysService;

public class OopersysManager
{
    public void setValue(int value)
    {
        try {
            mService.setValue(value);
        } catch (RemoteException e) {
        }
    }

    public String read(int maxLength) {...}

    public int write(String stringVal) {...}

    public OopersysManager(IopersysService service)
    {
        mService = service;
    }

    IopersysService mService;
}
```

6.3.2. - 4.x - Status bar

- Location:
 - frameworks/base/packages/SystemUI/src/com/android/systemui/statusbar
- Disable phone signal - SignalClusterView.java:

```
if (mMobileVisible && !mIsAirplaneMode) {  
    /* DISABLE  
    mMobileGroup.setVisibility(View.VISIBLE);  
    mMobile.setImageResource(mMobileStrengthId);  
    mMobileActivity.setImageResource(mMobileActivityId);  
    mMobileType.setImageResource(mMobileTypeId);  
    mMobileGroup.setContentDescription(mMobileTypeDescription + ...  
*/
```

- Disable battery meter -
policy/BatteryController.java:

```
/* DISABLE
for (int i=0; i<N; i++) {
    ImageView v = mIconViews.get(i);
    v.setImageResource(icon);
    v.setImageLevel(level);
    v.setContentDescription(mContext.getString(R.string.acces...
}
*/
```

6.3.2.-2.3.x - Status bar

- Location:
 - frameworks/base/packages/SystemUI/src/com/android/systemui/statusbar
- Look for:
 - mService.setIcon(...)
- Disable icons with:
 - mService.setIconVisibility("[ICON_NAME]", false);

6.3.3. Network

- Locations:
 - Global static:
 - frameworks/base/core/res/res/xml/apns.xml
 - Device static:
 - PRODUCT_COPY_FILES := vendor/acme/etc/apns-conf-us.xml:system/etc/apns-conf.xml
 - Dynamic:
 - system/etc/apns-conf.xml
- Format:

```
<apn carrier="T-Mobile US"
      mcc="310"
      mnc="260"
      apn="wap.voicestream.com"
      user="none"
      server="*"
      password="none"
      proxy="216.155.165.50"
      port="8080"
      mmssc="http://216.155.174.84/servlets/mms"
/>
```

6.3.4. Browser bookmarks

- See packages/apps/Browser/res/values/strings.xml

```

    <item>http://www.msn.com/</item>
    <item>MySpace</item>
    <item>http://www.myspace.com/</item>
...

```

6.3.5. Email provider customization

- See packages/apps>Email/res/xml/providers.xml

```
<!-- Gmail variants -->
<provider id="gmail" label="Gmail" domain="gmail.com">
    <incoming uri="imap+ssl+://imap.gmail.com" username="$email"/>
    <outgoing uri="smtp+ssl+://smtp.gmail.com" username="$email"/>
</provider>
<provider id="googlemail" label="Google Mail" domain="googlemail.com">
    <incoming uri="imap+ssl+://imap.googlemail.com" username="$email"/>
    <outgoing uri="smtp+ssl+://smtp.googlemail.com" username="$email"/>
</provider>
...
<!-- Common US providers -->

<provider id="aim" label="AIM" domain="aim.com">
    <incoming uri="imap://imap.aim.com" label="IMAP" username="$email"/>
    <outgoing uri="smtp://smtp.aim.com:587" username="$email"/>
</provider>
<provider id="aol" label="AOL" domain="aol.com">
    <incoming uri="imap://imap.aol.com" label="IMAP" username="$email"/>
    <outgoing uri="smtp://smtp.aol.com:587" username="$email"/>
</provider>
...
...
```

6.3.6. Themes

- See
framework/base/core/res/res/values/styles.xml

Inside Android's UI

- Android's UI, what's that?
- Architecture Basics
- Display Core
- OpenGL
- Input Layer
- Relevant Apps and Services
- System Startup
- References and Pointers

1. Android's UI, what's that?

???

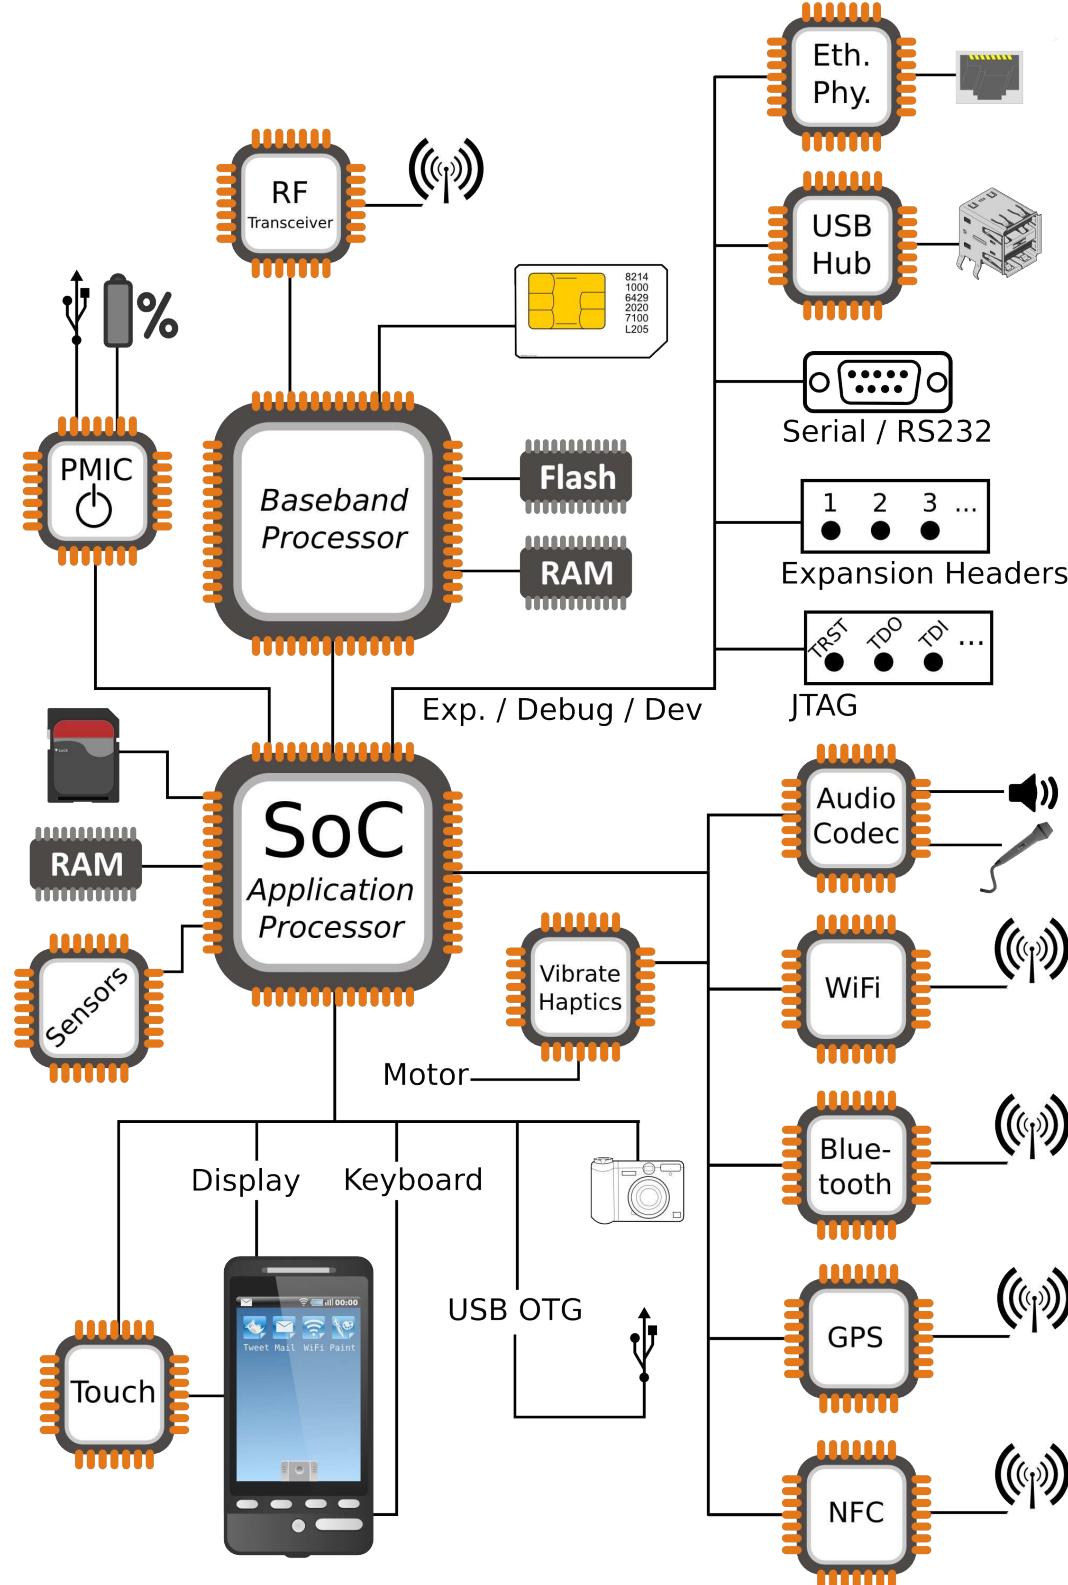

- SoC / GPU
- Touch input
- LCD
- Keyboard

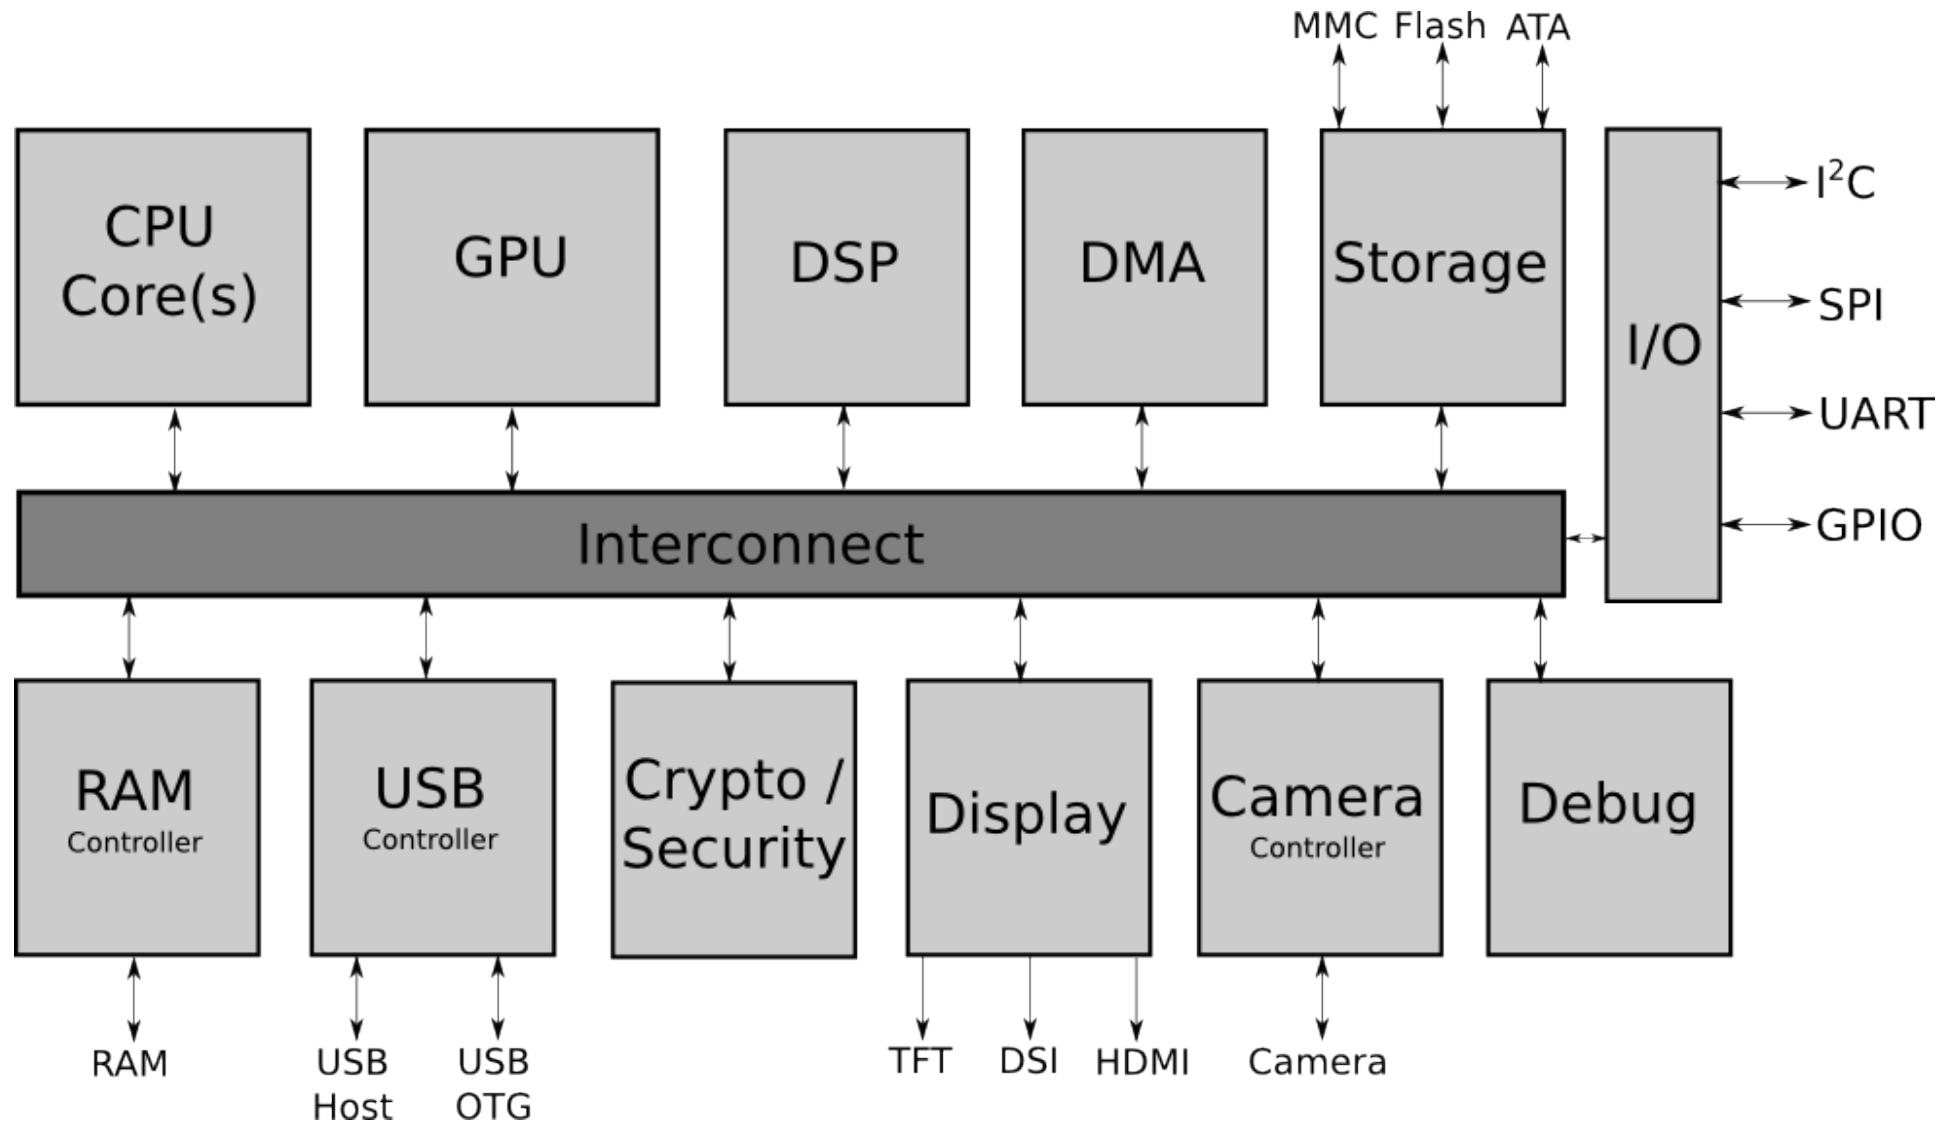

1.1. What's NOT covered here

- Media layer
- StageFright
- Video playback
- Camera
- DRM
- Etc.

2. Architecture Recap

- Hardware used to run Android
- AOSP
- Binder
- System Services
- HAL

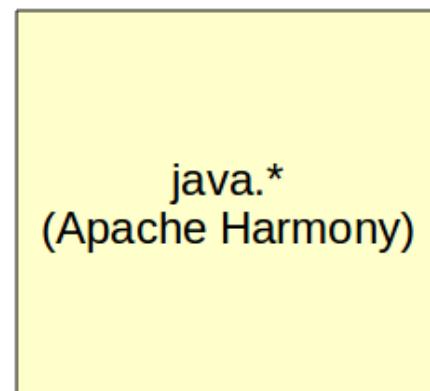

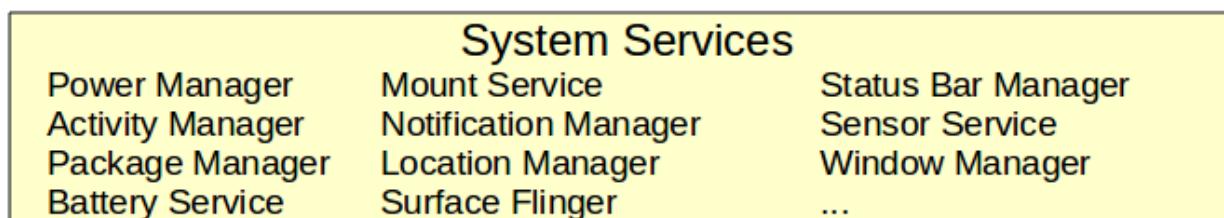

App API

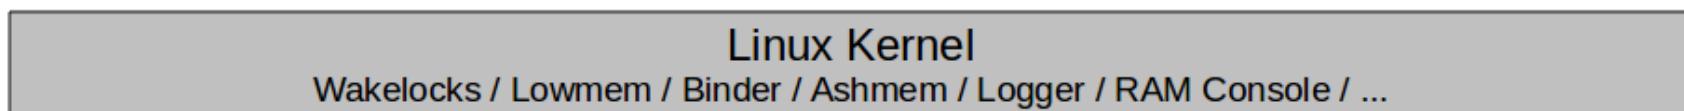

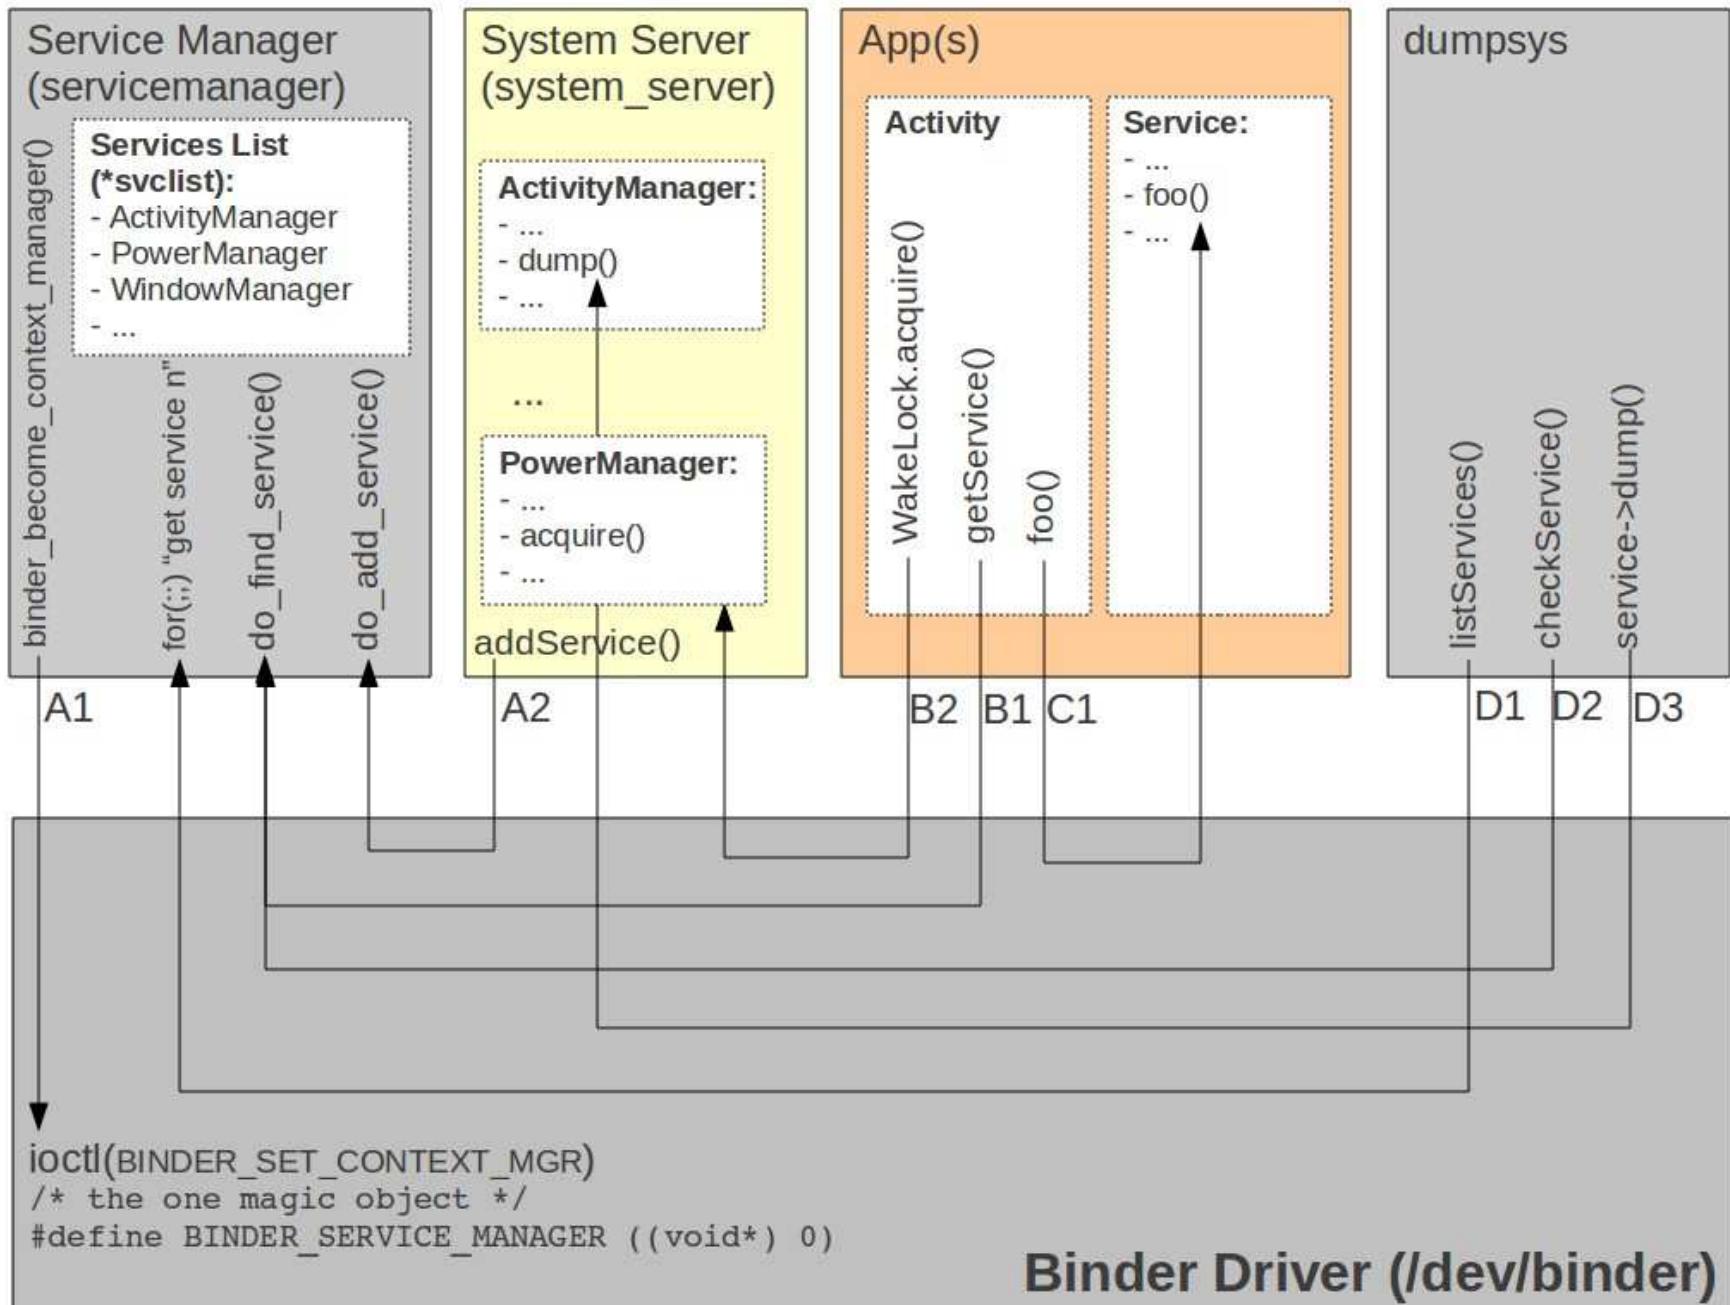

Your Apps / Market Apps

Binder

JNI

System Services

System Server

Java-built Services

Power Manager Mount Service
Activity Manager Notification Manager
Package Manager Location Manager
Battery Service Search Service
Window Manager Wallpaper Service
Status Bar Headset Observer
Clipboard Service ...

C-built Services

Sensor Service

Surface Flinger

Media Service

Audio Flinger
Media Player Service
Camera Service
Audio Policy Service

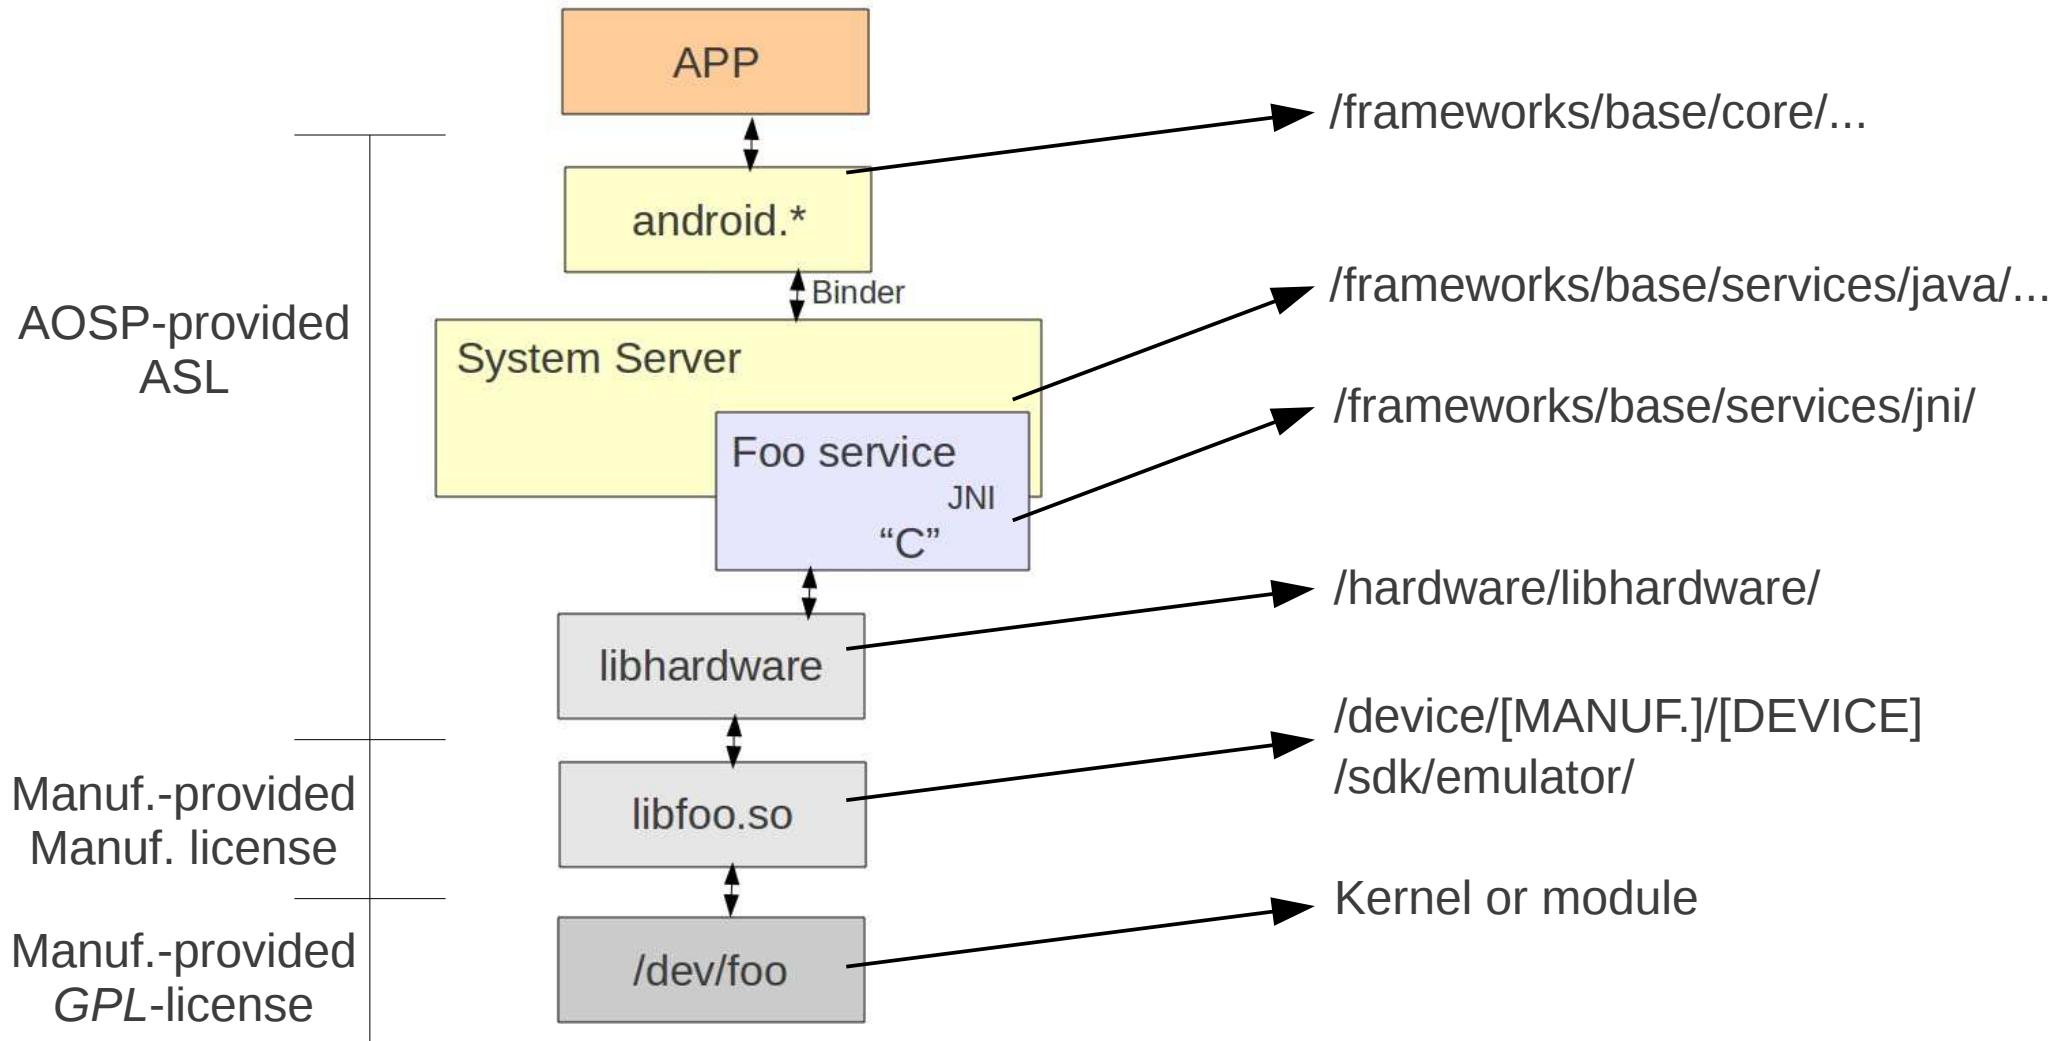

Includes:
• StageFright
• Audio effects
• DRM framework

Phone App

JNI

Native Methods for
Java-built Services

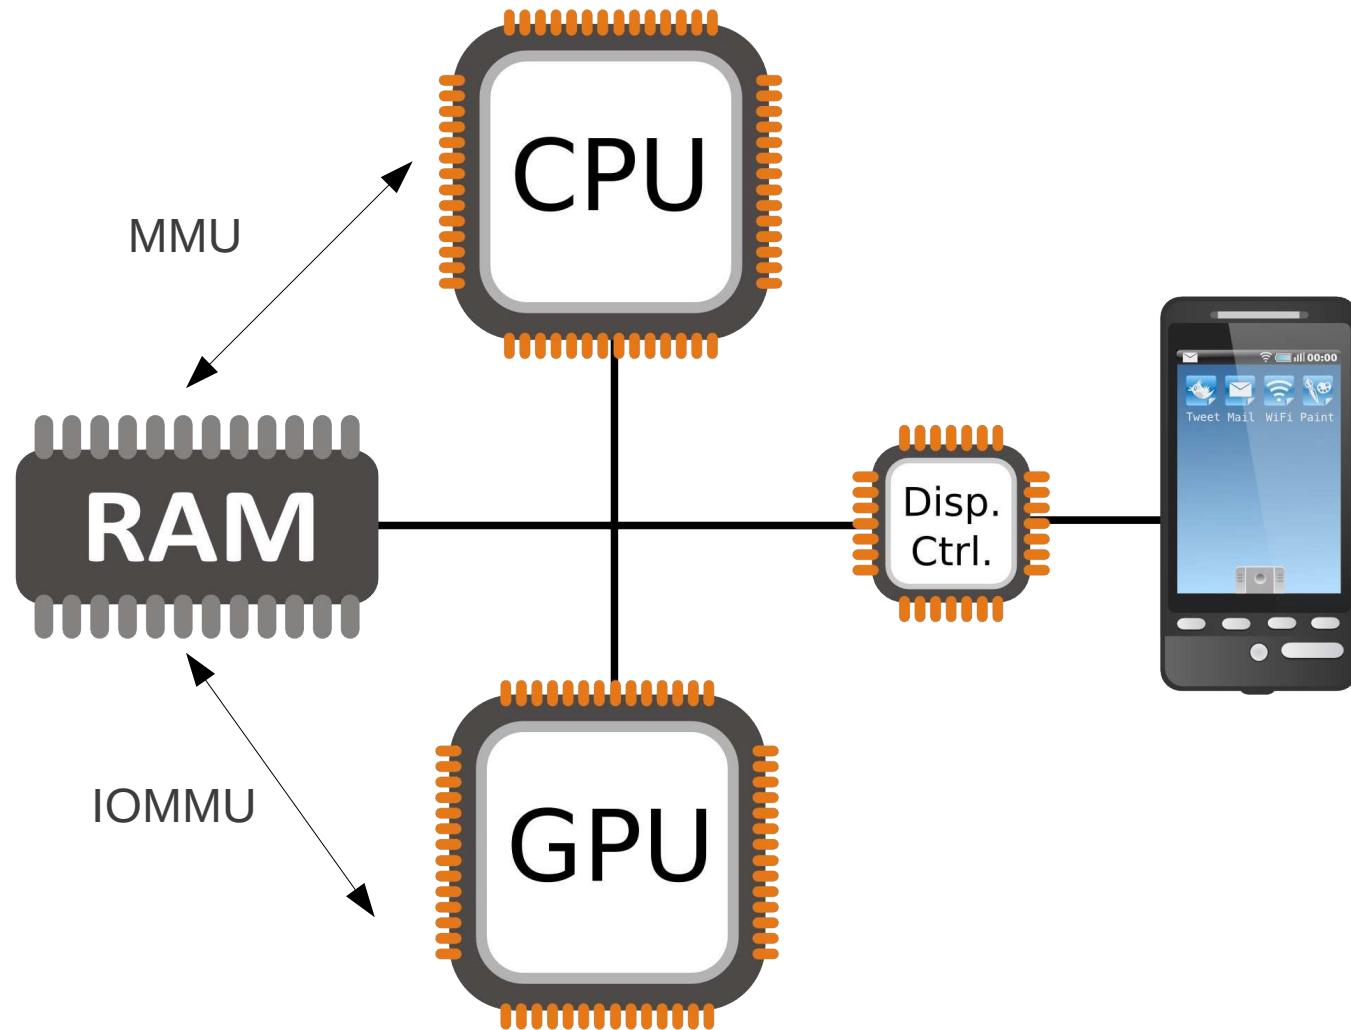

Hardware Abstraction Layer

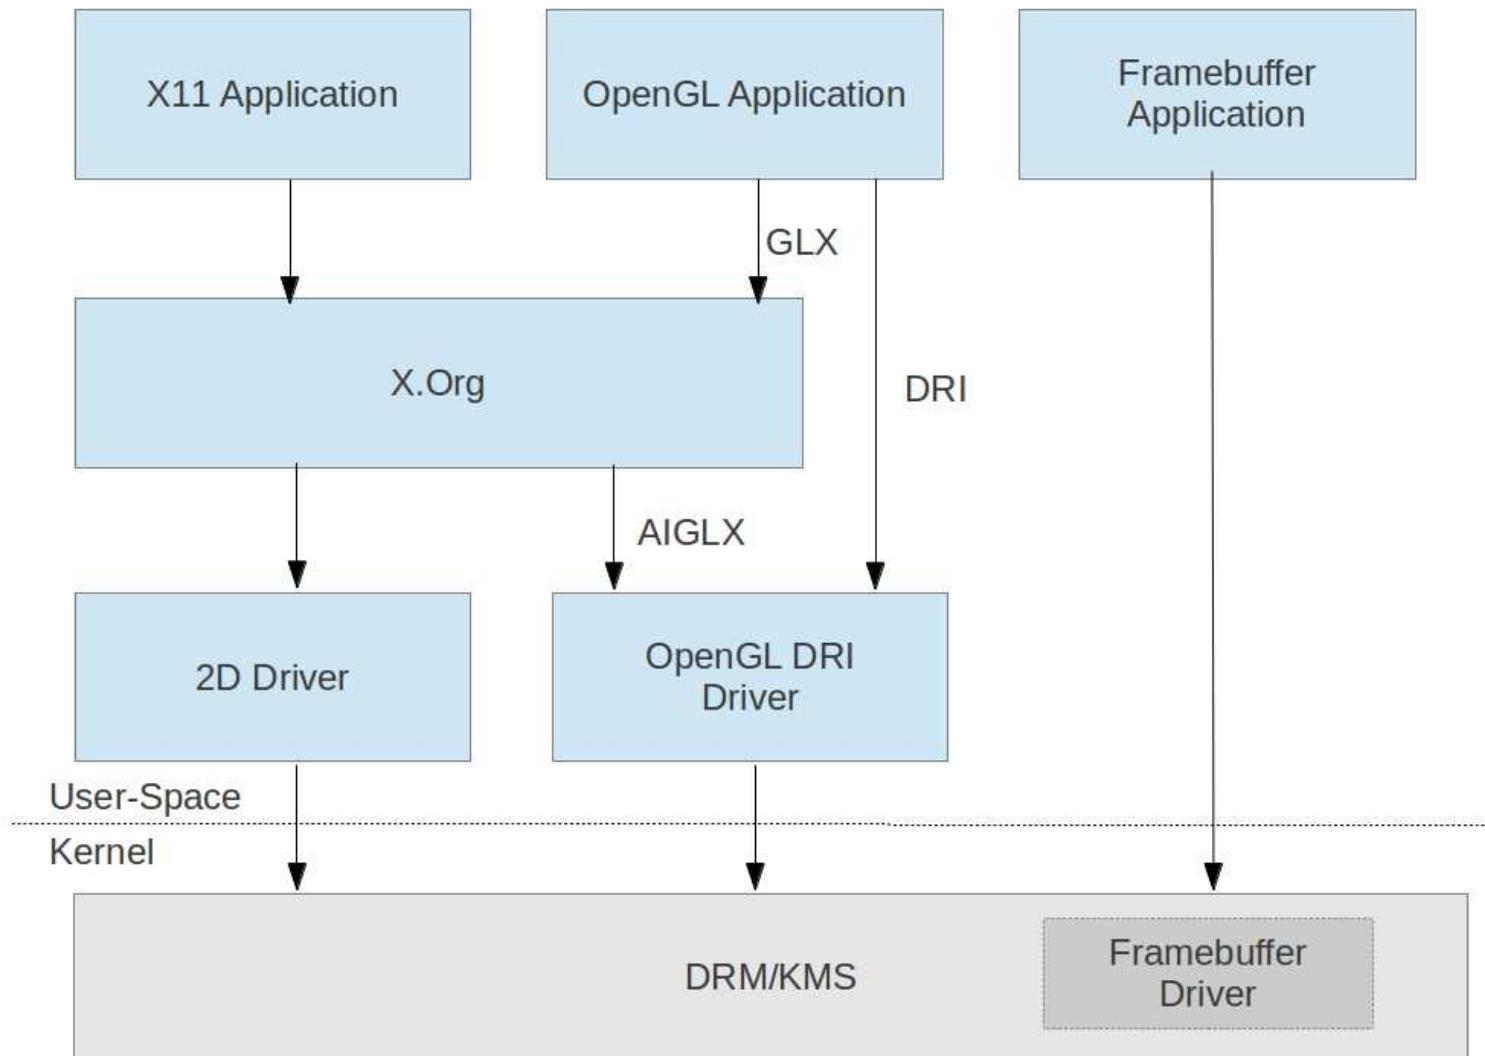

3. Display Core

- Display Hardware
- Classic Linux display stack
- Display stack in Android
- Kernel driver
- HAL definition
- HAL module
- Surface Flinger
- Window Manager
- Walkthrough

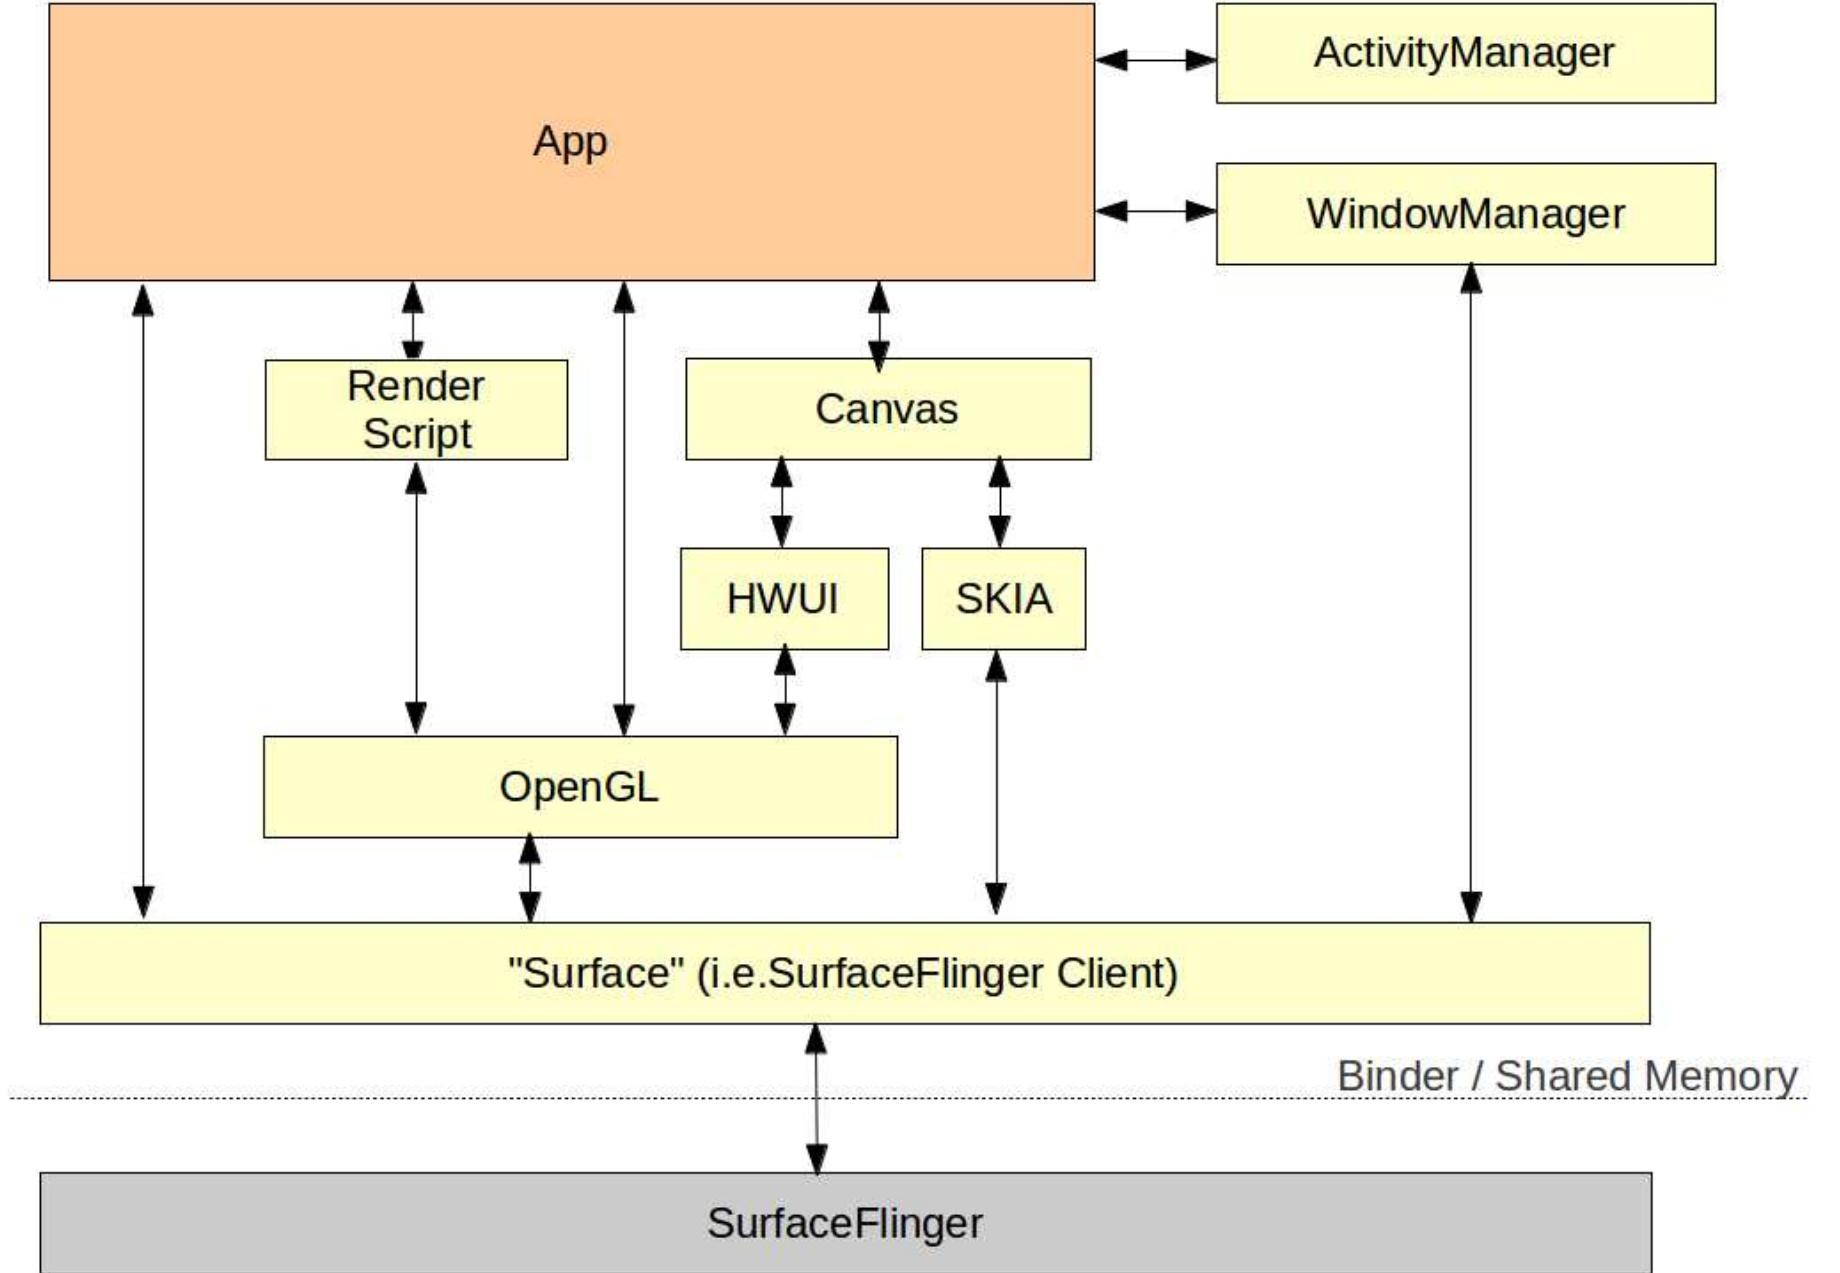

3.1. Display Hardware

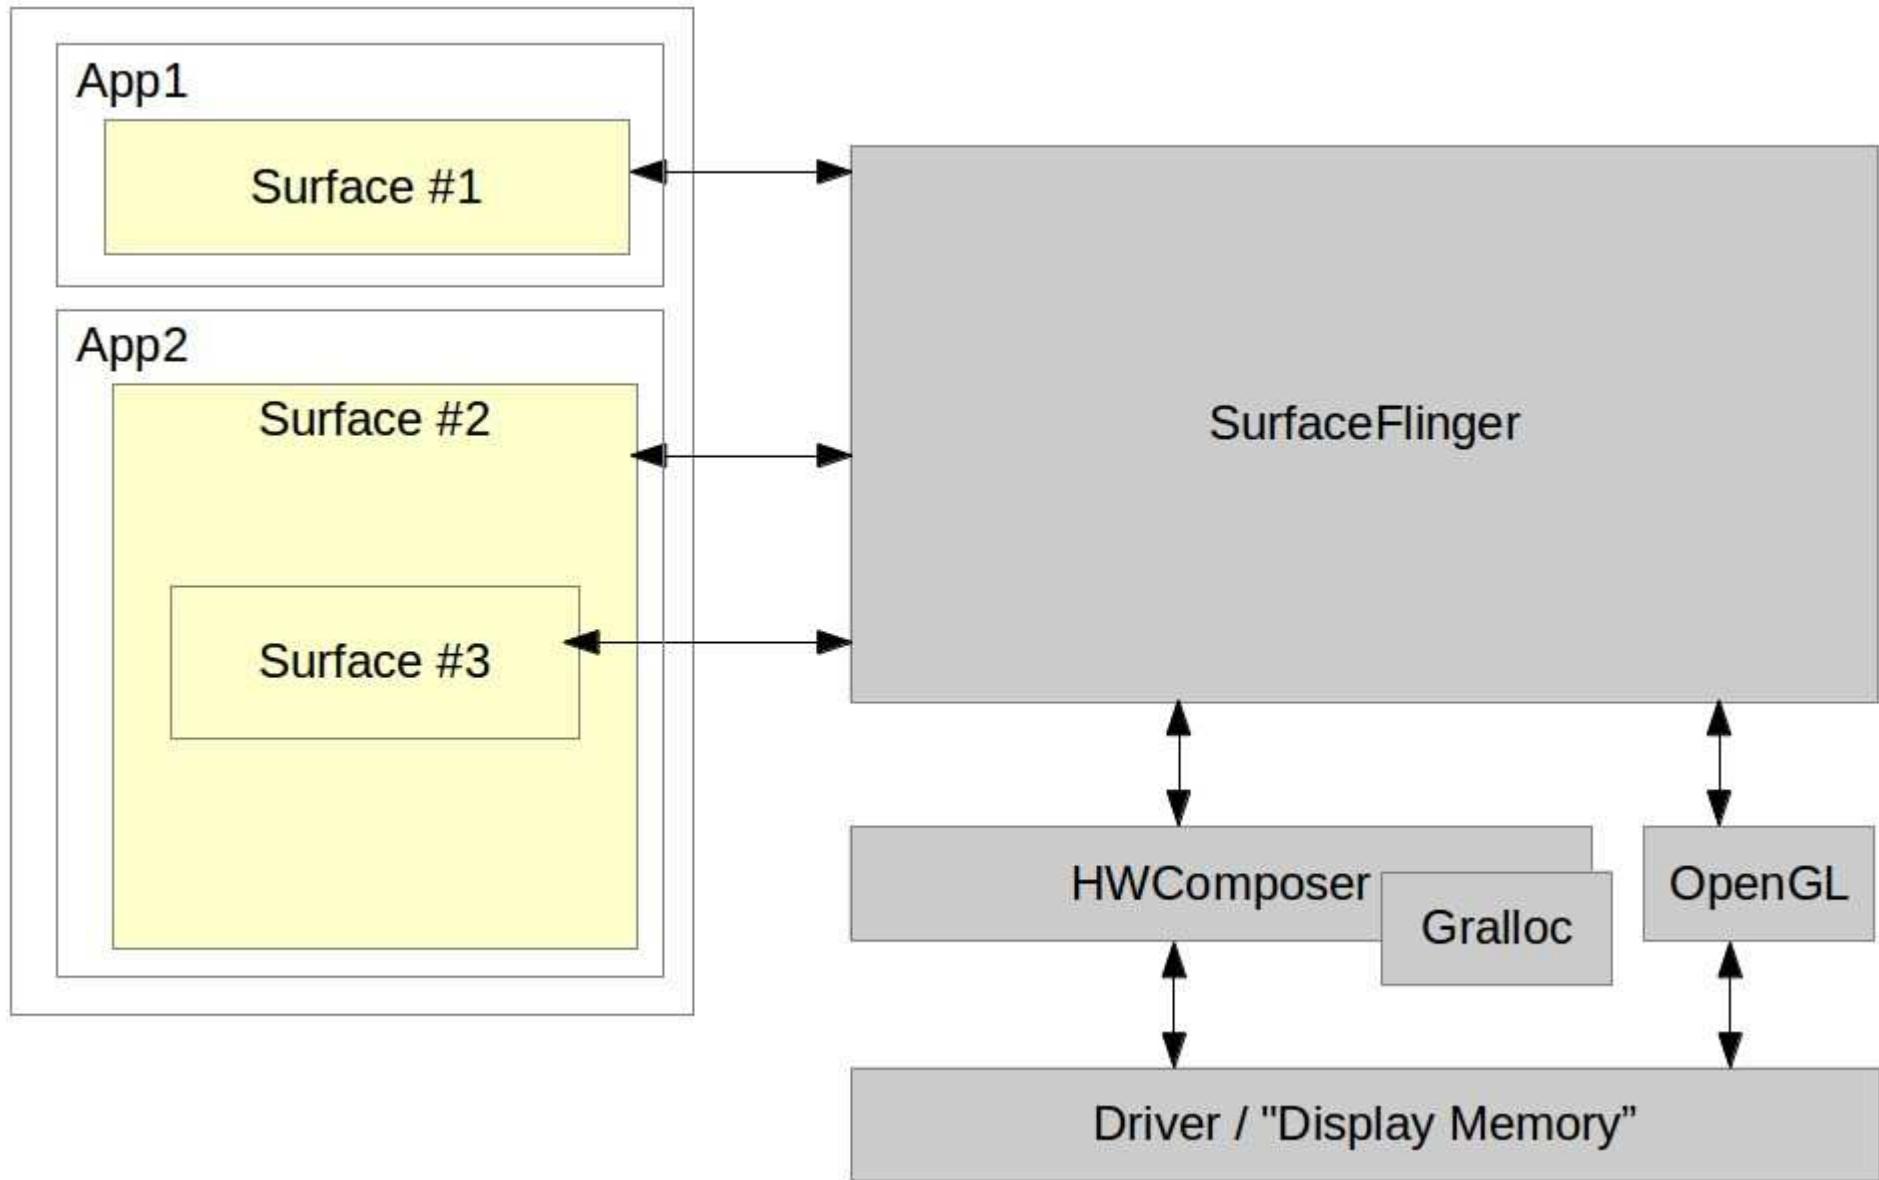

3.2. Classic Linux display stack

3.3. Display stack in Android

3.4. Kernel driver

- Video memory management
- Mode setting
- Checking of parameters
- Motorola Xoom:
 - /dev/nvhdcpl
 - /dev/nvhost-ctrl
 - /dev/nvhost-display
 - /dev/nvhost-dsi
 - /dev/nvhost-gr2d
 - /dev/nvhost-gr3d
 - /dev/nvhost-isp
 - /dev/nvhost-mpe
 - /dev/nvhost-vi
 - /dev/nvmap
 - /dev/tegra-crypto
 - /dev/tegra_avp
 - /dev/tegra_camera
 - /dev/tegra_fuse
 - /dev/tegra_rpc
 - /dev/tegra_sema
- ... whatever hides in hwcomposer HAL module

3.5. HAL Definition

- /hardware/libhardware/include/hardware/hwcomposer.h
- struct hwc_procs:
 - invalidate()
 - vsync()
- struct hwc_composer_device:
 - prepare()
 - set()
 - dump()
 - registerProcs()
 - query()
 - *()

3.6. HAL module

- Skeleton /hardware/libhardware/modules/hwcomposer.cpp
- /system/lib/hw/hwcomposer.BOARD.so
- /system/lib/hw/gralloc.BOARD.so
- Ex. - Mot Xoom:
 - hwcomposer.tegra.so
 - gralloc.tegra.so
- Surface Flinger hook:
 - /frameworks/native/services/surfaceflinger/DisplayHardware
 - HWComposer.cpp
 - Provides fake vsync if none is provided in HW

3.7. Surface Flinger

- Actual server:
 - /frameworks/native/services/surfaceflinger
- Client side:
 - /frameworks/native/libs/gui
- Client / Server interface:
 - ISurfaceComposerClient.cpp
 - ISurfaceComposer.cpp
- This is NOT an aidl'ed service
- All communication is manually marshalled/unmarshalled

3.8. Window Manager

- Server side:
 - /frameworks/base/services/java/com/android/server/wm/
 - WindowManagerService.java
 - Session.java
- Client side:
 - /frameworks/base/core/java/android/view/
 - WindowManager.java
 - WindowManagerImpl.java
 - ViewRootImpl.java
- Interfaces:
 - IWindowManager.aidl
 - IWindowSession.aidl
- Parameters (incl. z-order):
 - See WindowManager.java

3.9. Walkthrough

- Activity Manager relies on Activity Thread
- AT calls on attach() and makeVisible()
- makeVisible does wm.addView()
- wm.addView() - this also called by StatusBar to display itself
 - Creates a new ViewRootImpl
 - Call on its setView()
- setView() calls on mWindowSession.addToDisplay(...)
- This results in call to WM's addWindow()
- ViewRootImpl's performTraversals()
 - Calls on relayoutWindow()
 - Calls to WM session's relayout()
 - Call to WM's relayoutWindow()
 - Call to createSurfaceLocked()
 - new Surface(...)

frameworks/base/core/java/android/**

LocalActivityManager.java: startActivity()

- moveToState()

 - startActivityNow()

ActivityThread.java: startActivityNow()

- performLaunchActivity()

 - attach() -- gets AM handle and ties to it

- handleResumeActivity()

 - makeVisible()

Activity.java: makeVisible()

 - wm.addView()

WindowManagerGlobal.java: addView()

- root = new ViewRootImpl()

 - root.setView()

ViewRootImpl.java: setView()

 - mWindowSession.addToDisplay()

IWindowSession.aidl: addToDisplay()

frameworks/base/services/java/com/android/server/wm/*

Session.java: addToDisplay()

- mService.addWindow()

WindowManagerService.java: addWindow()

...

frameworks/base/core/java/android/**/*

ViewRootImpl.java: performTraversals()

- relayoutWindow()

- mWindowSession.relayout()

frameworks/base/services/java/com/android/server/wm/*

Session.java: relayoutWindow()

- mService.relayoutWindow()

WindowManagerService.java: relayoutWindow()

- surface = winAnimator.createSurfaceLocked();

WindowStateAnimator.java: createSurfaceLocked()

- new Surface();

4. OpenGL

- What's OpenGL?
- What's in a modern-day GPU?
- Software layers involved
- Kernel driver
- EGL libs
- Native interface
- Java interface
- Software GL implementation

4.1. What's OpenGL?

- It's just an API ... nothing but an API ...
- Check out Wikipedia
- Multiple versions out
- “ES” versions for embedded use
- Up to ES 3.0
- Android support up to ES 2.0

4.2. What's in a modern-day GPU?

- A tremendous amount of parallel processing units
- “SIMD”-like instruction set
- Video decoding/encoding capabilities
- ...

4.3. Software layers involved

- Kernel driver
- GL libraries
- Native GL API
- Java GL API

4.4. Kernel driver

PROPRIETARY

4.5. EGL libs

- /frameworks/base/native/opengl/libs
- Entry point: /system/lib/libEGL.so
- Looks for /system/lib/egl/egl.cfg
- /system/lib/egl - Mot Xoom:
 - egl.cfg
 - libEGL_perfhud.so
 - libEGL_tegra.so
 - libGLES_android.so
 - libGLESv1_CM_perfhud.so
 - libGLESv1_CM_tegra.so
 - libGLESv2_perfhud.so
 - libGLESv2_tegra.so
- egl.cfg:

0 0 tegra

4.6. Native interface

- /frameworks/native/opengl/include
 - EGL
 - ETC1
 - GLES
 - GLES2
 - KHR

4.7. Java interface

- GL libs required by libandroid_runtime.so
- /frameworks/base/opengl/java/android/opengl:
 - ...

4.8. Software GL implementation

- /frameworks/native/opengl/libegl

5. Input Layer

- Kernel side - “std” Linux input layer:
 - /dev/input/*
- No HAL use
- Native lib:
 - libinput
 - /frameworks/base/services/input
- Input Manager Service:
 - /frameworks/base/services/java/com/android/server/input
 - Started and directly tied to Window Manager
- Specific config files (see source.android.com)
- Soft keyboard:
 - /frameworks/base/core/java/android/inputmethodservice
- Input methods:
 - /packages/inputmethods
 - <http://developer.android.com/guide/topics/text/creating-input-method.html>

6. Relevant Apps and Services

- Launcher
- StatusBar
- Wallpaper Manager Service
- Notification Service
- App Widgets

6.1. Launcher

- An app like any other
- See /packages/app/Launcher2

6.2. StatusBar

- A unique app
- See /frameworks/base/packages/SystemUI
- Connects to Status Bar Manager and gives an interface it can use to call back into Status Bar
- Can use setIcon() to display icons on the right
- Provides a CPU usage add-on that renders straight on rest of display using higher z-order

6.3. Wallpaper Manager Service

- See
`/frameworks/base/services/java/com/android/server/WallpaperManagerService.java`

6.4. Notification Service

- Toasts
- Status bar notifications
- Gets handle to Status Bar Service at instantiation
- Uses handle to communicate with Status Bar

6.5. App Widgets

- See
`/frameworks/base/services/java/com/android/server/AppWidgetService.java`

7. System Startup

- Kernel
- Init
- Boot animation
- Launcher

7.1. Boot animation

- Started by Surface Flinger
- “bootanim” binary
- /frameworks/base/cmds/bootanimation
- Relies on bootanimation.zip w/ PNGs (nothing but)
- See
https://github.com/CyanogenMod/android_vendor_cm/tree/jellybean/prebuilt/common/bootanimation
- Must contain a desc.txt:

```
<width> <height> <fps>
p <count> <pause> <path>
p <count> <pause> <path>
```

8. References and Pointers

- “Use the source, Luke”
- Jim Huang's “Android Graphics”
- Benjamin Zores' “Linux Magazine / France” articles
- MIPS article on graphics internals:
<http://developer.mips.com/2012/04/11/learning-about-android-graphics-subsystem/>
- Stéphane Marchesin's “Linux Graphics Drivers: an Introduction”
<http://source.android.com/tech/input/index.html>

Running Code in Android

1. Programming Languages
2. Standard App Mechanisms
3. Special App Mechanisms
4. Starting Apps
5. Native Utilities and Daemons
6. Java Utilities (and Daemons)
7. System Services
8. Shell Scripts
9. init.rc Commands and Services
10. C Libraries
11. Java Libraries
12. SDK add-ons

1. Programming Languages

- Java:
 - Apps
 - Platform
- C:
 - Apps
 - Platform
- JavaScript / CSS / HTML
 - WebKit object
- C#:
 - Mono for Android
- Misc.
 - Any language for which there's a Linux compiler / interpreter

2. Standard App Mechanisms

- Components:
 - Activity
 - Service
 - Content Provider
 - Broadcast Receiver
- “Application” Component
- Widgets

2.1. “Application” Component

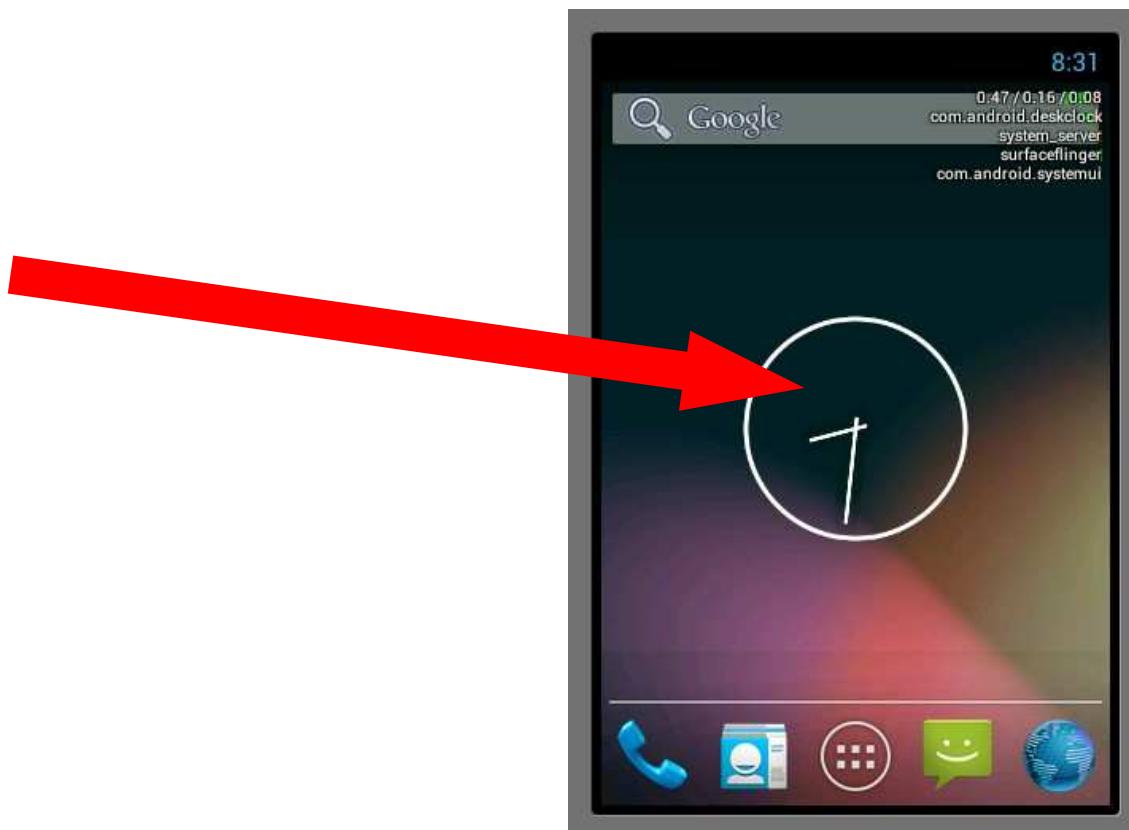

- See packages/apps/Phone:
 - Especially src/com/android/phone/PhoneApp.java

```
/**  
 * Top-level Application class for the Phone app.  
 */  
public class PhoneApp extends Application {  
    PhoneGlobals mPhoneGlobals;  
  
    public PhoneApp() {  
    }  
  
    @Override  
    public void onCreate() {  
        if (UserHandle.myUserId() == 0) {  
            // We are running as the primary user, so should bring up the  
            // global phone state.  
            mPhoneGlobals = new PhoneGlobals(this);  
            mPhoneGlobals.onCreate();  
        }  
    }  
    ...  
}
```

2.2. Widgets

- See:

<https://developer.android.com/guide/topics/appwidgets>

3. Special App Mechanisms

- Foreground services
- Persistent apps
- Sync adapters
- Backup agents
- Input methods engines
- Alarm services
- Live wallpapers
- Account managers
- Device administrators
- “Core” app

3.1. Foreground services

- Sticky notification icon
- Ex:
 - Skype
 - Avast
- See:
 - <https://developer.android.com/guide/components/services.html#Foreground>
 - <https://developer.android.com/reference/android/app/Service.html#startForeground%28int,%20android.app.Notification%29>
 - https://developer.android.com/reference/android/app/Notification.html#FLAG_FOREGROUND_SERVICE

3.2. Persistent apps

- Flag in <application> decl. in manifest:
 android:persistent="true"
- For “system” apps only
- Will cause app to be kept alive by ActivityManager
- IOW:
 - It'll be automagically restarted if it dies
 - Lifecycle won't result in it dying

3.3. Sync adapters

- For sync'ing with a cloud service
- Typically for REST-based apps
- Ex.: a Twitter-like feed
- See:
 - <http://www.google.com/events/io/2010/sessions/developing-RESTful-android-apps.html>

3.4. Backup Agents

- Triggered by Backup Manager
- See:
 - <https://developer.android.com/guide/topics/data/backup.html>

3.5. Input methods Engines

- Virtual on-screen keyboards
- See:
 - <https://developer.android.com/guide/topics/text/creating-input-method.html>

3.6. Alarm services

- Cause Intent to trigger in the future:
- See:
 - <https://developer.android.com/reference/android/app/AlarmManager.html>

3.7. Live wallpapers

- Animated wallpapers
- See:
 - <http://www.vogella.com/articles/AndroidLiveWallpaper/article.html>

3.8. Account managers

- For managing accounts in Settings
- See:
 - <https://developer.android.com/reference/android/accounts/AccountManager.html>

3.9. Device administrators

- Enterprisification feature:
- See:
 - <https://developer.android.com/guide/topics/admin/device-admin.html>

3.10. “core” app

- Use this tag in <manifest> tag:
 coreApp="true"

- Used by:
 - StatusBar
 - SettingsProvider
 - See frameworks/base/packages/
- See “onlyCore” variable in SystemServer.java
- Causes only core apps to start if set to “true”
- Default hard-coded as “false”
- PackageManagerService.java has detail of how it's used

4. Starting Apps

- Intents
- Content Resolvers

5. Native Utilities and Daemons

- Compile as part of AOSP:
`BUILD_EXECUTABLE`
- Build outside AOSP and merge:
 - Link statically (like adbd), or
 - Link dynamically (against Bionic or glibc or ...)
- Run like any regular Linux command-line tool
- Start from:
 - adb shell
 - init.rc
 - shell script
 - Android app (N.B. This will continue running independently)
- Plenty of existing examples: netd, vold, installd, etc.

5.1. Start from Android app

```
Process myUtil;  
BufferedReader myCliOutput;  
  
myUtil =  
    Runtime.getRuntime().exec("my_cli_util -P params");  
  
myCliOutput =  
    new BufferedReader(  
        new InputStreamReader(  
            myUtil.getInputStream()));
```

6. Java Utilities (and Daemons)

- Coded as a “library”
- Launched using app_process utility
- Use script to wrap call to app_process
- See frameworks/base/cmds for examples:
 - am
 - pm
 - svc
 - ...
- No known case of “daemon”, but should be feasible
 - Closest is System Server, but it's started from Zygote, not directly from app_process

7. System Services

- Start in:
 - Existing Java system services
 - App (like Phone or NFC)
 - C daemon (like Media Service or SurfaceFlinger)
- Register with Service Manager
- Provide API speak with system service:
 - In existing framework
 - As SDK add-on

8. Shell Scripts

- Android has built-in shell
- Since 4.0, MirBSD Korn Shell
- See: <https://www.mirbsd.org>
- Start shell script like any other native utility
- For example, init.goldfish.rc does:

```
service goldfish-setup /system/etc/init.goldfish.sh
    user root
    group root
    oneshot
```

9. init.rc Commands and Services

- Edit relevant init.*.rc to:
 - Add commands to existing actions
 - Create new actions based on global property triggers
 - Add new services
- See:
 - system/core/root/init.rc
 - device/[vendor]/[product]/init.*.rc

10. C Libraries

- Build libs as part of AOSP or using NDK:
`BUILD_SHARED_LIBRARY`
- Use library in native utility or daemon:
`LOCAL_SHARED_LIBRARIES := libfoo ...`
- Provide headers files as needed
- Can load library explicitly in Java, esp. for JNI
- See “HelloJNI” example in NDK for NDK ex.

```

public class HelloJni extends Activity
{
    /** Called when the activity is first created. */
    @Override
    public void onCreate(Bundle savedInstanceState)
    {
        super.onCreate(savedInstanceState);

        /* Create a TextView and set its content.
         * the text is retrieved by calling a native
         * function.
         */
        TextView tv = new TextView(this);
        tv.setText( stringFromJNI() + " " + pid() );
        setContentView(tv);
    }

    /* A native method that is implemented by the
     * 'hello-jni' native library, which is packaged
     * with this application.
     */
    public native String stringFromJNI();
    ...
    /* this is used to load the 'hello-jni' library on application
     * startup. The library has already been unpacked into
     * /data/data/com.example.HelloJni/lib/libhello-jni.so at
     * installation time by the package manager.
     */
    static {
        System.loadLibrary("hello-jni");
    }
}

```

11. Java Libraries

- Build as part of AOSP:

BUILD_JAVA_LIBRARY

- Or create using Eclipse
- Will generate a .jar
- See:

- <http://www.vogella.com/articles/AndroidLibraryProjects/article.html>
- <http://stackoverflow.com/questions/3642928/adding-a-library-jar-to-an-eclipse-android-project>

12. SDK add-ons

- See device/sample/, esp.:
 - README
 - products/sample_addon.mk
 - sdk-addon/
 - frameworks/PlatformLibrary/
- Creates a ZIP file
- Extract in [sdk-dir]/add-ons/

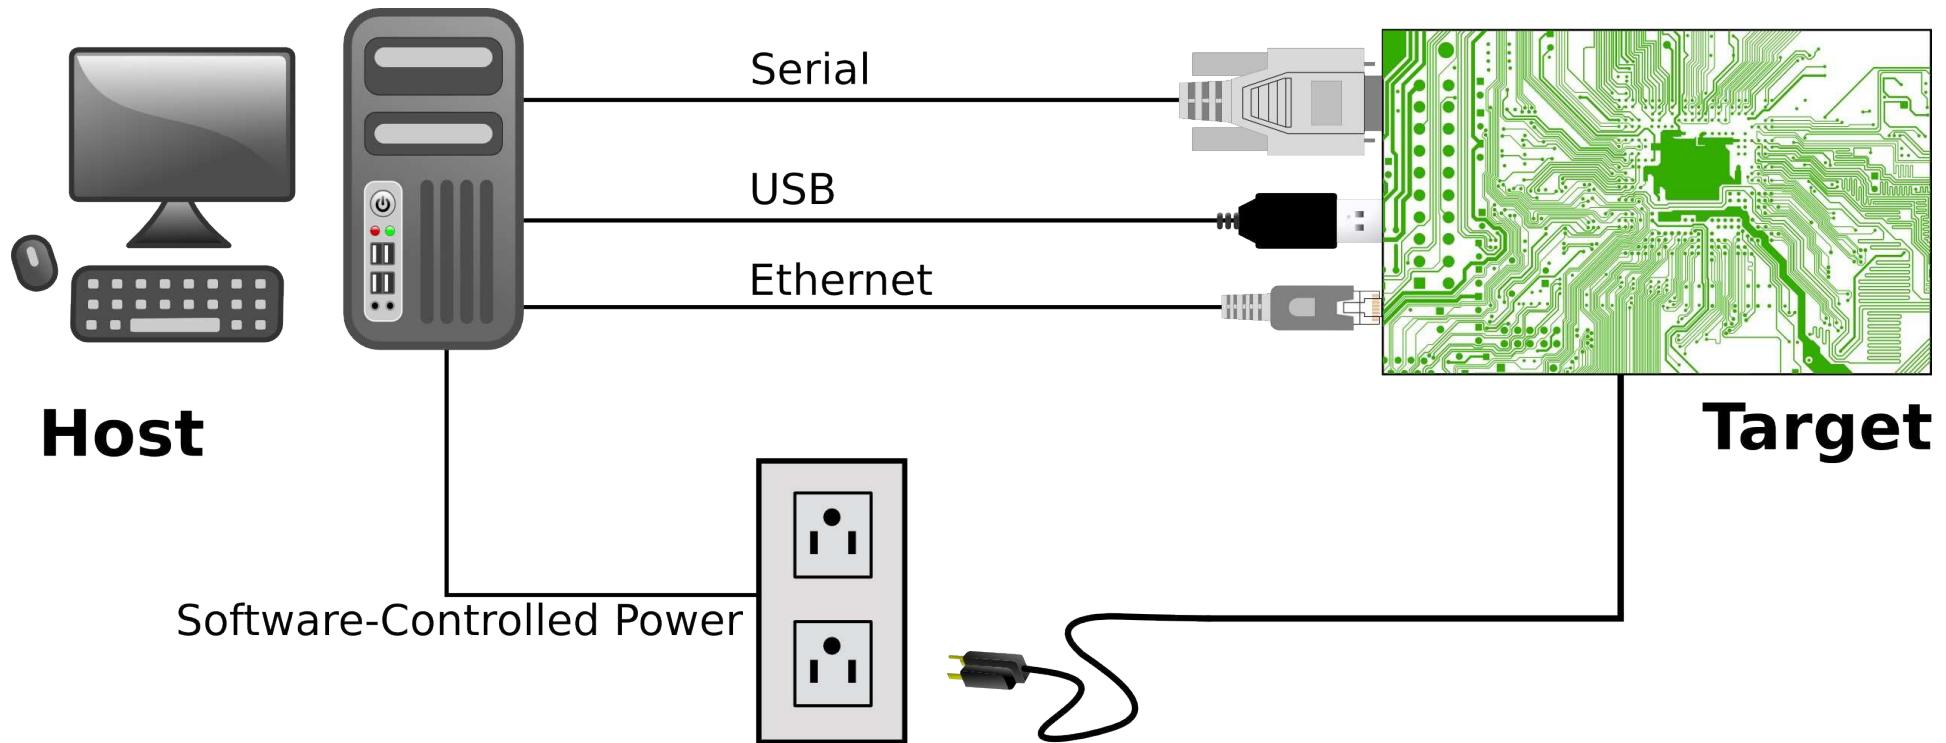

Debugging and Development

1. Development environment
2. Observing and monitoring
3. Interfacing with the framework
4. Working with the AOSP sources
5. Symbolic debugging
6. Detailed dynamic data collection
7. Benchmarking
8. Summing up

1. Development Environment

- Host / Target setup
- IDE / Editor
- Eclipse setup

1.1. Host / Target setup

1.2. IDE / Editor

Logos belong to their respective owners. This slide isn't CC-BY-SA.

321

1.3. Eclipse Setup

- Preparation
- Project importing
- AOSP fixups
- Browsing the sources

1.3.1. Preparation

- AOSP Basics:
 - Get AOSP ... from Google or otherwise
 - Extract if needed
 - Configure, build, etc.
- Eclipse / ADT:
 - Get ADT bundle from developer.android.com
 - Extract
 - Start and update and if needed

- Set up basic classpath file:

```
[aosp]$ cp development/ide/eclipse/.classpath .
```

- Adjust eclipse.ini

- On my ADT bundle, it's:

- adt-bundle-linux-x86_64-20130917/eclipse/eclipse.ini

- Change this:

- XX:MaxPermSize=256m

- Xms40m

- Xmx768m

- To this:

- XX:MaxPermSize=256m

- Xms128m

- Xmx768m

1.3.2. Project importing

- Start Eclipse
- Create new "Java project"
 - Project name = your AOSP name
 - Deselect "Use default location"
 - Location = path to your AOSP
 - Click "Next"
 - Wait a little bit ...
 - Click "Finish"
 - Wait for it to build your project
 - ... it likely will fail ...

1.3.3. AOSP fixups

- Need to fix AOSP classpath file and sources
- Assuming 4.3 here
- Add this:

```
<classpathentry kind="src" path="frameworks/opt/timezonepicker/src"/>
<classpathentry kind="src" path="frameworks/opt/colorpicker/src"/>
<classpathentry kind="src" path="frameworks/opt/datetimepicker/src"/>
<classpathentry kind="src"
path="frameworks/support/v8/renderscript/java/src"/>
```

- Remove this:

```
<classpathentry kind="src"
path="frameworks/support/renderscript/v8/java/src"/>
```

- Comment out a couple of things:

```
<!-- Redefines android.util.pools which confuses Eclipse  
<classpathentry kind="src" path="packages/apps/Gallery2/src"/>  
<classpathentry kind="src" path="packages/apps/Gallery2/src_pd"/>  
<classpathentry kind="src"  
path="packages/apps/Gallery2/gallerycommon/src"/>  
-->  
<!--  
<classpathentry kind="src" path="packages/apps/Nfc/src"/>  
<classpathentry kind="src" path="packages/apps/Nfc/nci/src"/>  
-->  
<!--  
<classpathentry kind="src" path="frameworks/ex/carousel/java"/>  
-->
```

- Manually build the following (cd to and "mm" -- or remove from .classpath:

packages/apps/Stk

packages/screensavers/WevView

development/samples/ApiDemos

development/samples>HelloActivity

development/samples/Home

development/samples/LunarLander

development/samples>NotePad

development/samples>RSSReader

development/samples/SkeletonApp

development/samples/Snake

- Edit
packages/apps/Launcher/src/com/android/launcher
2/DragLayer.java and modify:

```
private boolean isLayoutRtl() {
```

- to

```
public boolean isLayoutRtl() {
```

- **Now: right-click on project and select "Refresh"**
- It might still show "x" on some parts until it's done
rebuilding the project

1.3.4. Browsing the sources

- Mouse-over object type to be taken to declaration
- Browse classes through “Outline”
- Browse Call Hierarchy
- View recently viewed files (Ctrl-e)
- Many other shortcuts, see:
 - <http://source.android.com/source/using-eclipse.html>
- Issues:
 - Can't compile with Eclipse ... still need “make”
 - For Java only

2. Observing and Monitoring

- Native
- Framework
- Overall

2.1. Native

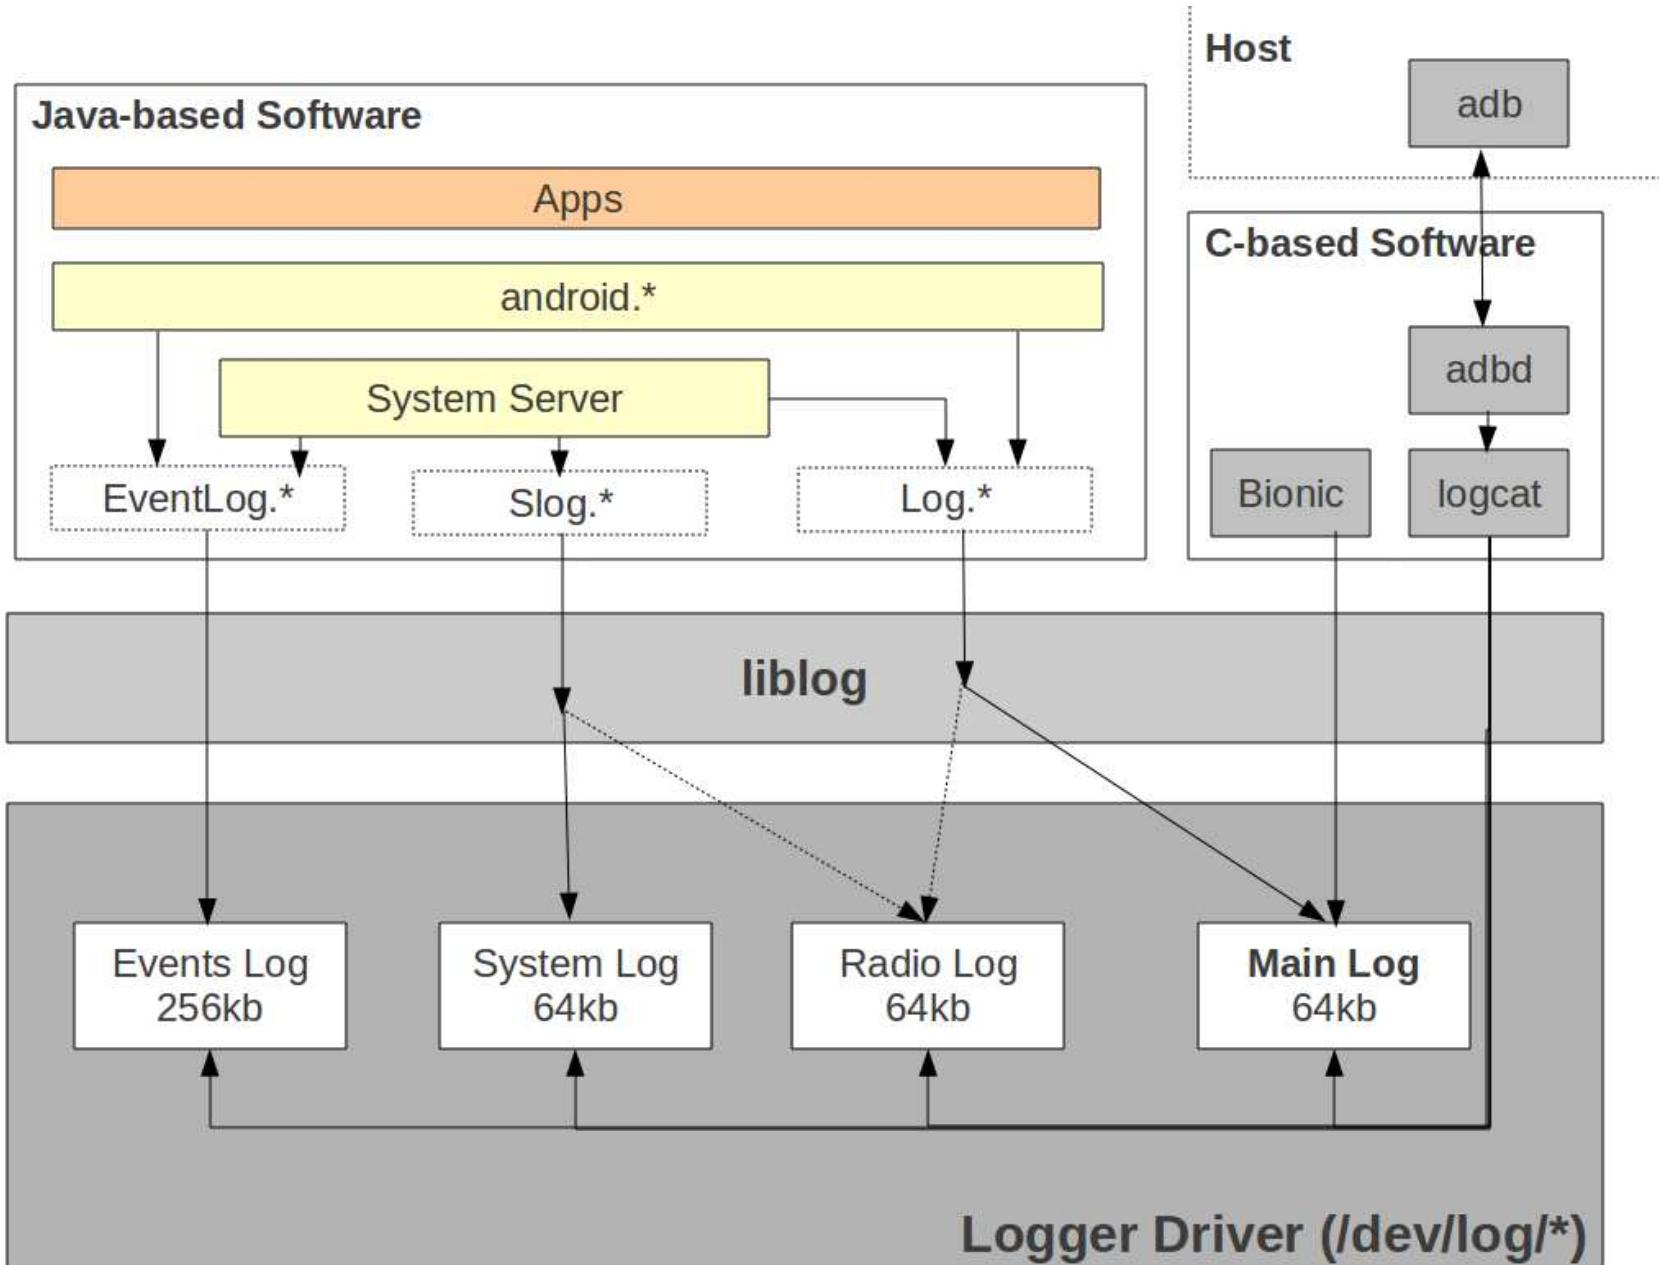

- schedtop
- librank
- procmem
- procrank
- showmap
- latencytop

2.2. Framework

- dumpsys
- service

2.3 Overall

- logcat
- dumpstate / bugreport
- watchprop / getprop

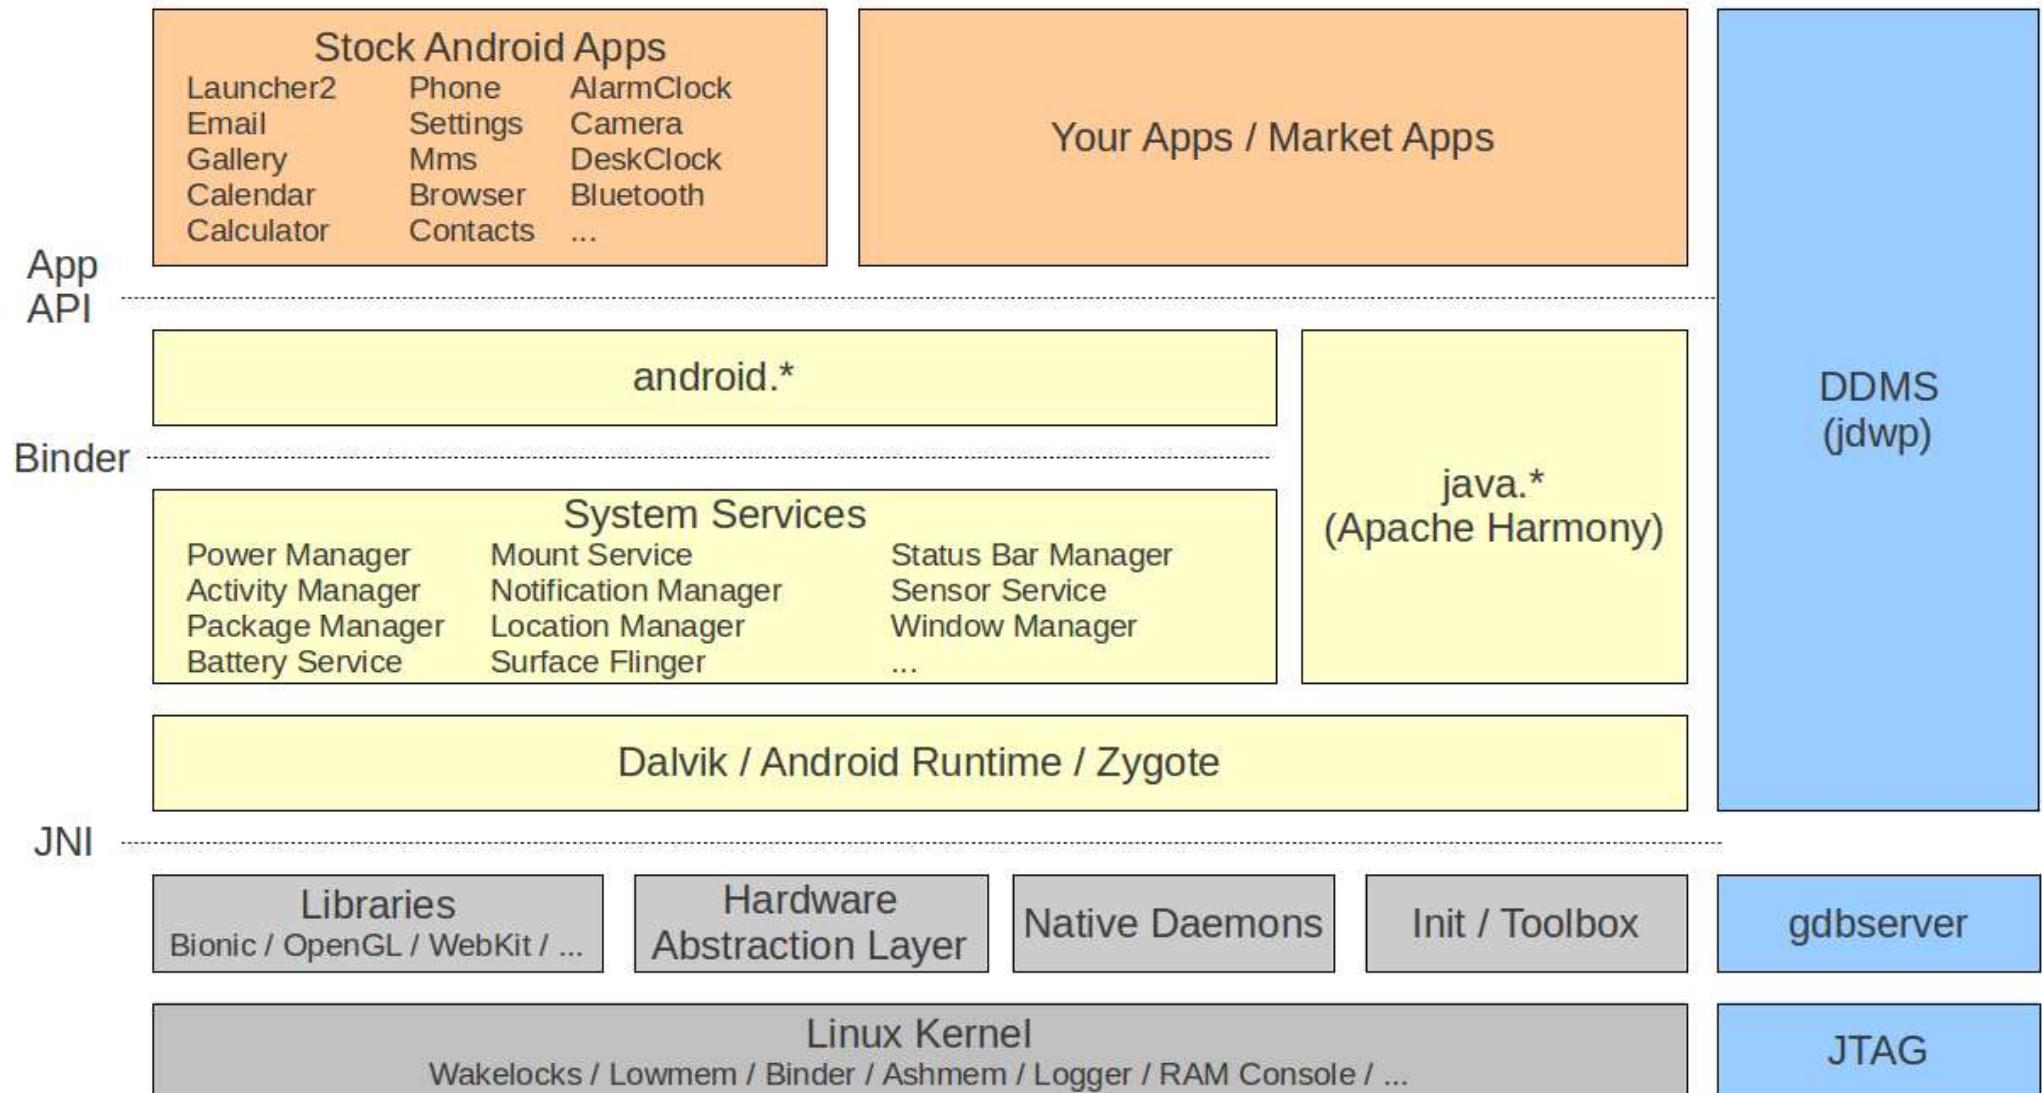

3. Interfacing With the Framework

- start / stop
- service call
- am
- pm
- wm
- svc
- monkey
- setprop

4. Working with the AOSP Sources

- You really need to check build/envsetup.sh
- Some tricks:
 - godir
 - croot
 - mm
 - m
 - jgrep
 - cgrep
 - resgrep
- It takes time to wrap your head around the tree

5. Symbolic Debugging - basics

5.1. DDMS / Eclipse integration

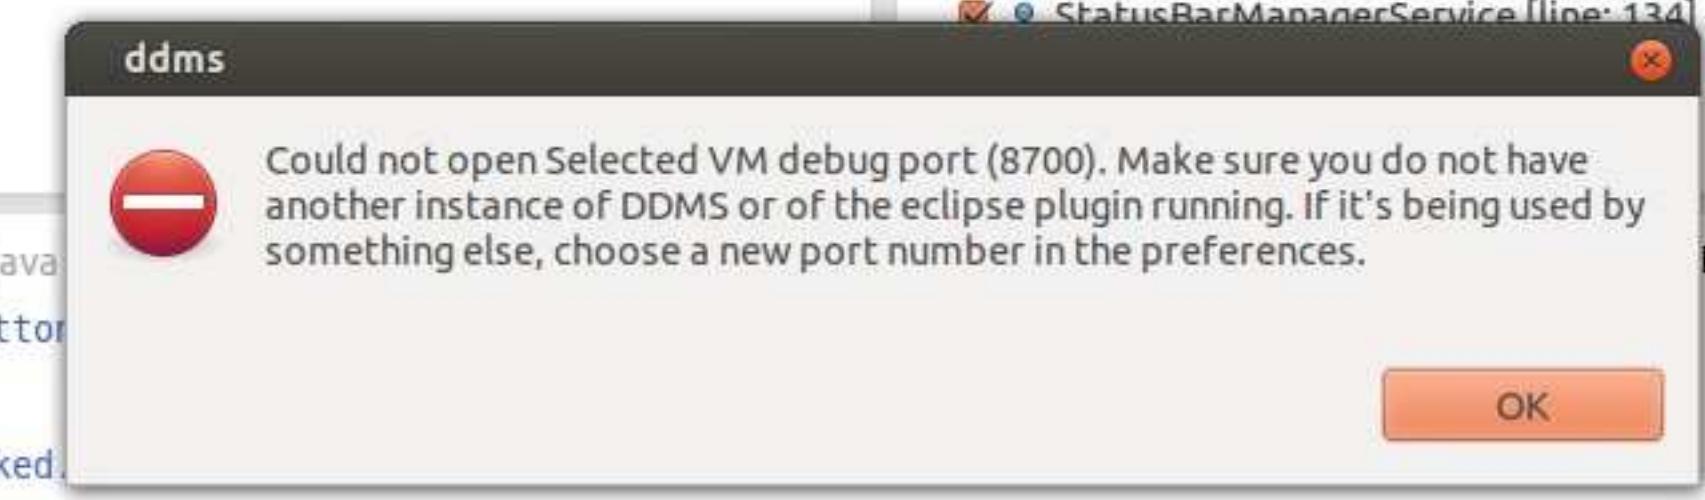

- Start DDMS:
 - The one from the AOSP's command-line
 - Not the one from Eclipse ("connection refuse")
- It takes some time to load -- a few **minutes**
- Each process has a separate host-side socket
- Select the process you want to debug:
 - It'll get port 8700

- Go to Eclipse:
 - Run->Debug Configurations->Remote Java Application
 - Connection Type: "Standard (Socket Attach)"
 - Host: localhost
 - Port: 8700

5.2. Starting debug w/ Eclipse

- Order is finicky:
 - Start your device or emulator
 - Start command-line DDMS before Eclipse otherwise you'll get this in logcat:

"I/jdwp (411): Ignoring second debugger -- accepting and dropping"
 - Start Eclipse
 - Eclipse will complain that there's already a DDMS running. Ignore that.

5.3. Debugging

- Select the process you want to debug in DDMS
- Go into Eclipse and click on the debug configuration you created earlier
- Check that the little green bug is beside your process in DDMS
- Again, things can look like they're freezing, this is "normal" for Eclipse ...
- Wait for Eclipse to show your Dalvik process in the "Debug" *window* in the "Debug" *view* -- all threads should show

Dalvik Debug Monitor

com.android.systemui	672		8608
com.android.mms			8609

og

5.4. Debugging multiple processes

- In the debug *view* of eclipse, click on "Debug" for every time you change the process in DDMS
- Wait for that process' threads to load in the debug view
- Once threads are loaded, you can actually start debugging

5.5. gdbserver - target side

- First, you'll need to make sure your C code is compiled appropriately. Add this to Android.mk:

```
LOCAL_CFLAGS += -ggdb  
LOCAL_STRIP_MODULE = false
```

- Attaching to running process

```
# gdbserver --attach localhost:2345 30
```

- Start app for debugging with gdbserver prepended

```
# gdbserver localhost:2345 service list
```

- Forward the port on the host:

```
$ adb forward tcp:2345 tcp:2345
```

5.6. gdb - host side

- Load file ****FIRST**** and then attach on host side

```
$ prebuilts/gcc/linux-x86/arm/arm-eabi-4.7/bin/arm-eabi-gdb

```

- Even if you try attaching to the specific thread in the system server running the system service you're trying to instrument, you'll get the same issue.
- Probably requires rebuilding gdbserver with thread support:
 - <https://sourceware.org/ml/gdb/2009-01/msg00084.html>
 - <http://code.google.com/p/android/issues/detail?id=9713>
- Issues seems to be solved in NDK but not in gdbserver in AOSP:
 - <http://comments.gmane.org/gmane.comp.handhelds.android.ndk/12122>

5.8. How to know what's the address of the library

```
# cat /proc/[system_sever PID]/maps | grep android_servers
4aff5000-4b007000 r-xp 00000000 1f:00 519          /system/lib/libandroid_servers.so
4b007000-4b008000 r--p 00011000 1f:00 519          /system/lib/libandroid_servers.so
4b008000-4b009000 rw-p 00012000 1f:00 519          /system/lib/libandroid_servers.so
# cat /proc/[system_sever PID]/maps | grep libc.so
40027000-4006c000 r-xp 00000000 1f:00 601          /system/lib/libc.so
4006d000-4006f000 r--p 00045000 1f:00 601          /system/lib/libc.so
4006f000-40071000 rw-p 00047000 1f:00 601          /system/lib/libc.so
$ objdump -h out/target/product/generic/system/lib/libandroid_servers.so | grep text
7 .text          00006ae8 000078b8 000078b8 000078b8 2***3
$ objdump -h out/target/product/generic/system/lib/libc.so | grep text
7 .text          0002f080 0000c9b8 0000c9b8 0000c9b8 2***3

4aff5000 + 000078b8 = 0x4AFFC8B8
40027000 + 0000c9b8 = 0x400339B8
```

<http://linux-mobile-hacker.blogspot.co.uk/2008/02/debug-shared-library-with-gdbserver.html>

5.9. JTAG

- Requires hardware device
- Sometimes interfaces with gdb
- Not Android specific
- Some allow transparent kernel/user-space debug
- Don't know of any that go all the way up to Dalvik

6. Detailed Dynamic Data Collection

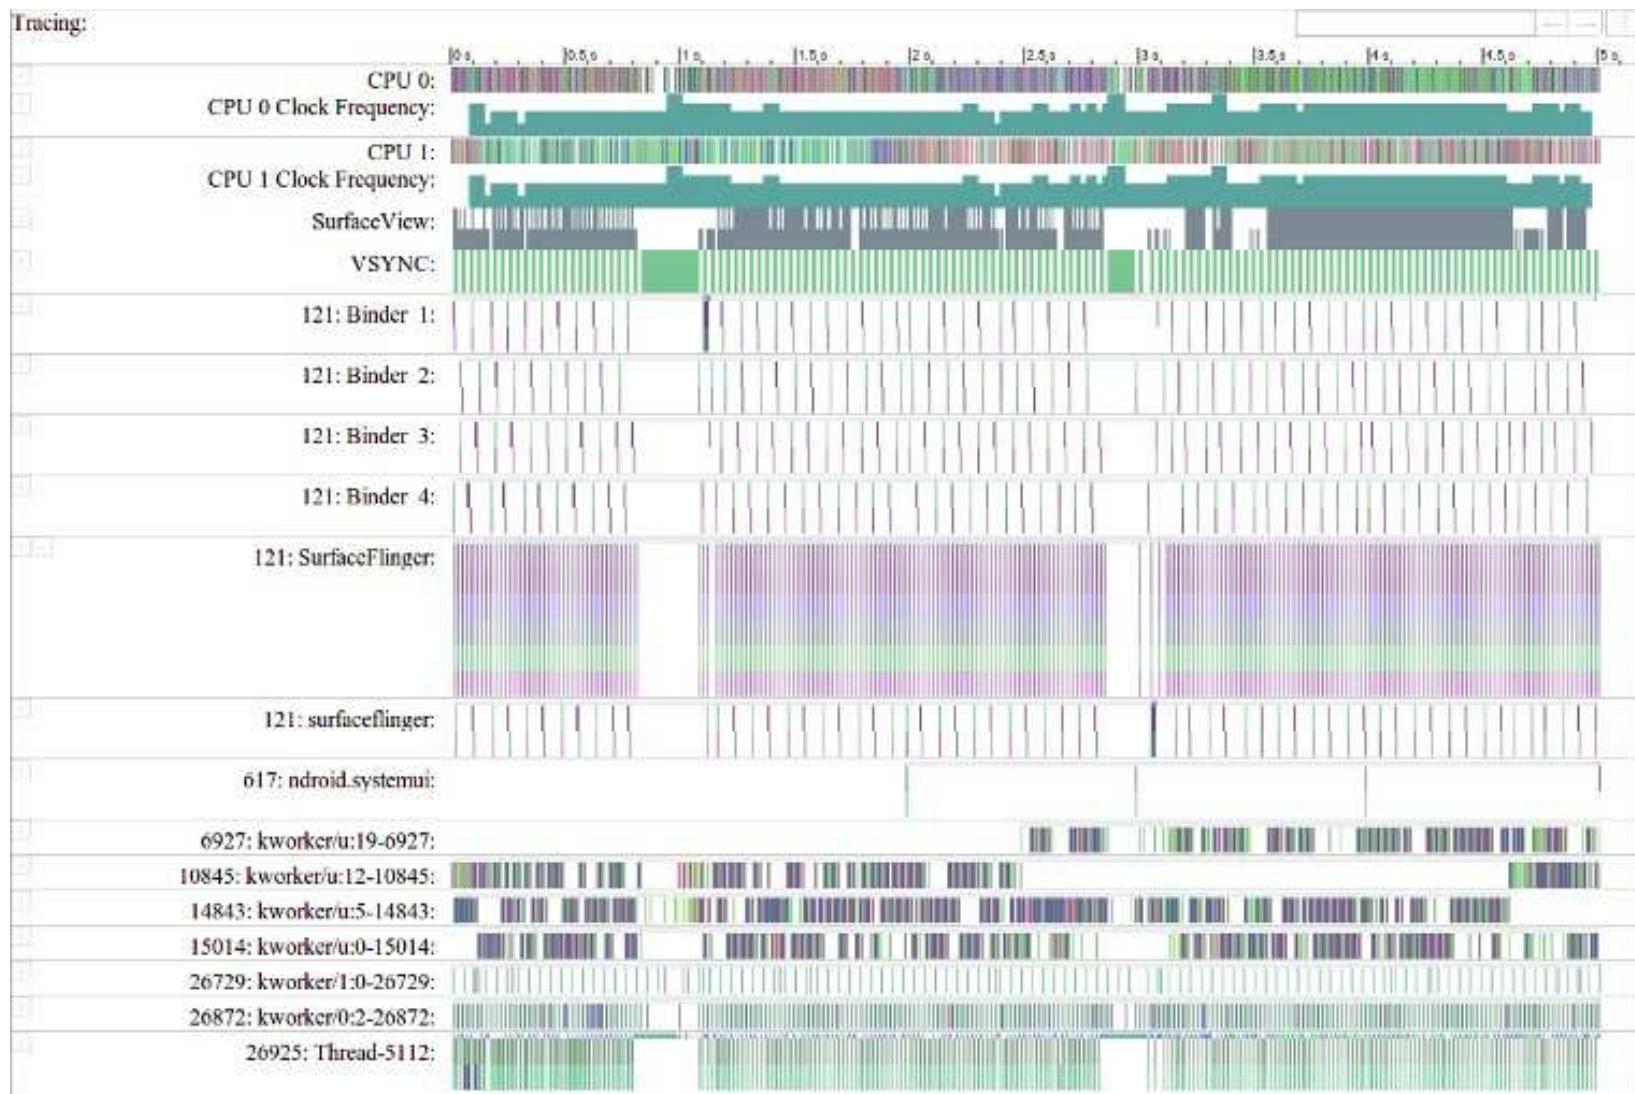

- Logging
- ftrace
- perf

6.1. Logging

- logcat is the most rapid/consistent way to observe dynamic behavior.
- Trivial to add instrumentation points
- **It just works ...**

6.2. ftrace

- With 4.1, Google introduced systrace/trace
- systrace is a Python script running on host side
- trace is native Android binary
- systrace calls trace via ADB
- trace uses ftrace to capture kernel events
- Stack instrumented to feed events to ftrace
- Google's doc:
 - <https://developer.android.com/tools/help/systrace.html>
 - <https://developer.android.com/tools/debugging/systrace.html>

.... trouble is

- I can't get it to work !*!@#\$&!#*\$!
- Default goldfish kernel doesn't have ftrace
- Able to build ftrace-enabled kernel for goldfish
- Can trace that system ... so long as I don't use atrace/systrace ... WTF¹?
- Not all Android kernels have ftrace enabled
- Generates HTML file that can only be read by Chrome ... **it doesn't work in Firefox**. NIH?

1: The AOSP sources define WTF as “What a Terrible Failure”. We trust they've done their research.

.... still

- Have a look at these files:
 - /external/chromium-trace/systrace.py
 - /frameworks/native/cmds/atrace
 - /frameworks/base/core/java/android/os/Trace.java
 - /frameworks/native/include/utils/Trace.h
 - /system/core/include/cutils/trace.h
 - /frameworks/native/libs/utils/Trace.cpp
- Look for:
 - ATRACE* in c/cpp files
 - Trace.traceBegin()/trace.traceEnd() in Java files

```
# atrace --help
usage: atrace [options] [categories...]
options include:
  -a appname          enable app-level tracing for a comma separated list of
cmdlines
  -b N                use a trace buffer size of N KB
  -c                  trace into a circular buffer
  -k fname,...        trace the listed kernel functions
  -n                  ignore signals
  -s N                sleep for N seconds before tracing [default 0]
  -t N                trace for N seconds [defualt 5]
  -z                  compress the trace dump
  --async_start       start circular trace and return immediatly
  --async_dump        dump the current contents of circular trace buffer
  --async_stop        stop tracing and dump the current contents of circular
                      trace buffer
  --list_categories   list the available tracing categories
```

```
# atrace --list_categories
    gfx - Graphics
    input - Input
    view - View System
    webview - WebView
    wm - Window Manager
    am - Activity Manager
    audio - Audio
    video - Video
    camera - Camera
    hal - Hardware Modules
    res - Resource Loading
    dalvik - Dalvik VM
```

6.3. perf on Android on ARM

360

7. Benchmarking

0xbench	RL Benchmark: SQL
AnTuTu	Benchmark & Tunning
Passmark	A1 SD Bench
Vellamo	Quick Benchmark Lite
Geekbench2	3DRating benchmark
SunSpider	Smartbench 2011
GLBenchmakr	NenaMark
Quadrant Standard Edition	Rightware Browsermark
Linpack	An3DBenchXL
Neocore	CaffeineMark
3DMark	NBench
Epic Citadel	Methanol
Androbench	AndEBench
CF-bench	SmartBench 2012
SD Tools	RealPi

8. Summing Up

- Works relatively well:
 - logcat
 - Eclipse / DDMS
 - Framework tools
- Works ok:
 - gdb/gdbserver
 - native tools
 - ftrace
- Doesn't work (for me):
 - strace/strace
 - perf

9. Loose ends

- strace
- debuggerd
- tombstones
- anr traces

Hacks, Variants, Tricks, and Resources

1. AOSP's limitations
2. Tearing AOSP apart
3. Forks
4. Ports
5. Mods
6. Melds
7. Headless Android

1. AOSP's limits

- Rigid
- Closed dev model
- Fits Google's prerogatives
- Excludes a lot of stuff
- ... IOW, doesn't always fit what you need

2. Tearing AOSP apart

- Forks
- Ports
- Mods
- Melds

3. Forks

- Cyanogenmod
- Replicant
- MIUI

3.1. Cyanogenmod

- After-market handset firmware
- Requires rooted phone
- <http://www.cyanogenmod.com>
- Advertized features:
 - Lockscreen Gestures
 - Phone Goggles
 - OpenVPN
 - Incognito mode
 - Themes support
 - DSP Equalizer

File Edit View History Bookmarks Tools Help

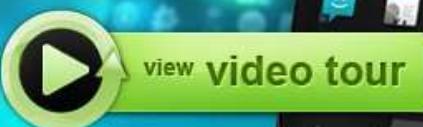

http://www.cyanogenmod.com/  Cyanogen^(mod)

ABOUT DEVICES BLOG FORUM COMMUNITY

What is CyanogenMod?

CyanogenMod is an aftermarket firmware for a number of cell phones based on the open-source Android operating system. It offers features not found in the official Android based firmwares of vendors of these cell phones.

 get cyanogen^(mod)

 view video tour

A customized aftermarket firmware distribution

Done

- More interestingly:
 - <http://wiki.cyanogenmod.com/>
 - <https://github.com/CyanogenMod>
 - Includes Busybox
 - Custom Launcher (ADWLauncher)
 - Lots of tiny tweaks and mods ... worth doing a “diff”

3.2. Replicant

- Android distro that is 100% Free Software
- <http://replicant.us/>
- Includes FDroid free software app store

The screenshot shows a web browser window with the URL <http://replicant.us/> in the address bar. The page content features a large red Android robot icon on the left and the word "Replicant" in a large, bold, black serif font. Below the main title is a horizontal navigation bar with links: Home, About, Applications, Contact, Devices, Download, FAQ, How to help, Wiki and Trac. At the bottom of the page, there is a news banner: "Replicant 2.2 preview 008 is out!" followed by a timestamp "Posted on June 23, 2011 by admin". To the right of the banner is a search bar and an "Archives" section.

3.3. MIUI

- Closed-source fork with slick UI enhancements
- Many translations
- <http://en.miui.com/>
- Advertized features:
 - Home screen
 - Dialer
 - SMS
 - Contacts
 - Themes
 - Camera
 - Gallery
 - Net disk, File manager, Traffic monitor, Backup, Notes, ...

4. Ports

- RIM Playbook
- BlueStacks
- Alien Dalvik

4.1. RIM Playbook

The screenshot shows a web browser window with the URL <http://us.blackberry.com/playbook-tablet/> in the address bar. The page content is the BlackBerry PlayBook landing page. At the top, there's a navigation bar with links for File, Edit, View, History, Bookmarks, Tools, and Help. Below the navigation bar is a toolbar with various icons. The main content area features the BlackBerry logo and the text "BlackBerry PlayBook." A large blue button labeled "Where to Buy" is visible. To the right, there's a large image of the BlackBerry PlayBook tablet displaying its home screen with various app icons like Music Store, CNN, and NFS Undercover. Below the tablet image, there's a section titled "Get to know the BlackBerry PlayBook" with the subtext "The world's first professional-grade tablet." and a "Explore now >" link.

Scripts Partially Allowed, 6/7 (facebook.com, atdmt.com, blackberry.com, 2o7.net, invitemedia.com, doubleclick.net) | <SCRIPT>: 55 | <OBJECT>: 0

Transferring data from us.blackberry.com...

4.2. BlueStacks

The screenshot shows a web browser window with the URL <http://www.bluestacks.com/> in the address bar. The page content is the official website for BlueStacks, featuring the BlueStacks logo and the tagline "Android Player for Windows". A large image on the left illustrates the integration of Android and Windows environments, with a hand pointing from a Windows desktop to an Android device. Text on the site includes "SIGN UP HERE TO BE AN ALPHA TESTER", "All your favorite Android apps now on Windows PC", and a "Play Video" button. A social media post from bluestacksinc is visible at the bottom right.

4.3. Alien Dalvik (Myriad Group)

Figure 2 : Alien Dalvik running Android Photoshop on Nokia N900 vs native application on HTC legend

Myriad Alien Dalvik runs the Photoshop Android application on a Nokia N900. The application shows exactly as the original application running on an HTC legend. While the mobile handsets are very similar - both using 600MHz ARM processors, performance appear the same or better on the Nokia thanks to the use of Myriad Dalvik Turbo technology.

Myriad Alien Dalvik on Meego

Myriad Alien Dalvik will be first commercially available on the MeeGo platform. A very tight integration to both the Android SDK and the MeeGo SDK (QTCreator) makes it very easy to modify, package and test applications.

Most Android applications can run unmodified as the vast majority of Android APIs are supported and tight integration with the QT framework leads to a seamless user experience.

Ported applications demonstrate no loss of performance compared to the Android applications running in the native environment, thanks to Myriad Dalvik Turbo technology. As an example, when running on the Nokia N900, Myriad Alien Dalvik demonstrates similar or superior performances.

First implemented on the Meego/Maemo platform, Myriad Alien ~~Dalvik~~ can support other platforms, to be developed depending on customers needs.

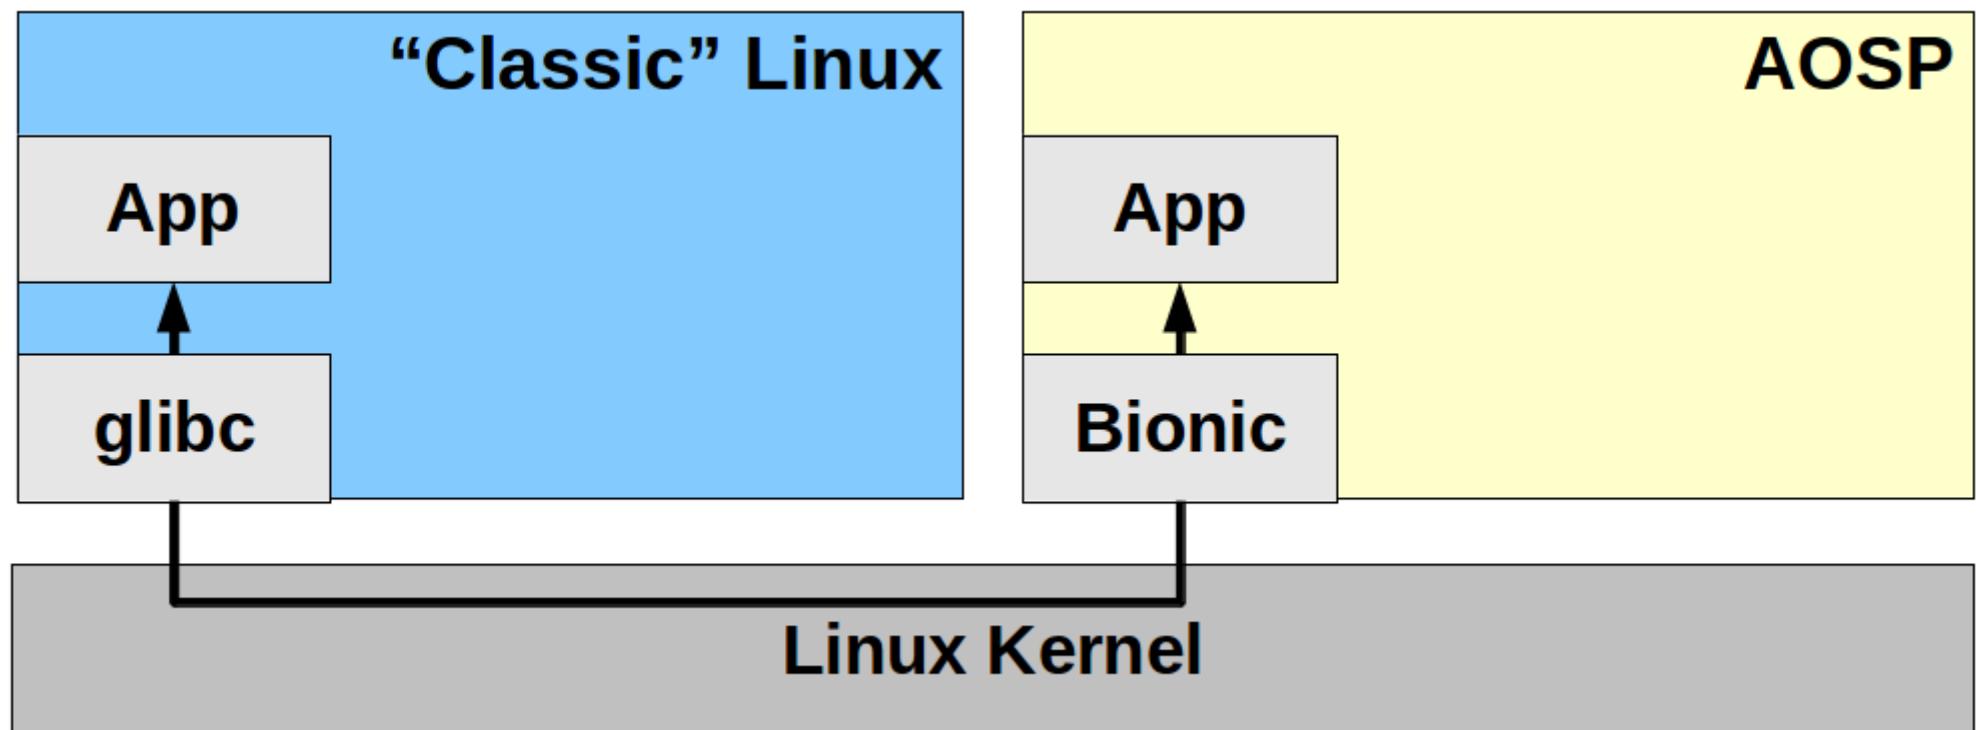

5. Mods

- XDA Developers
- ...

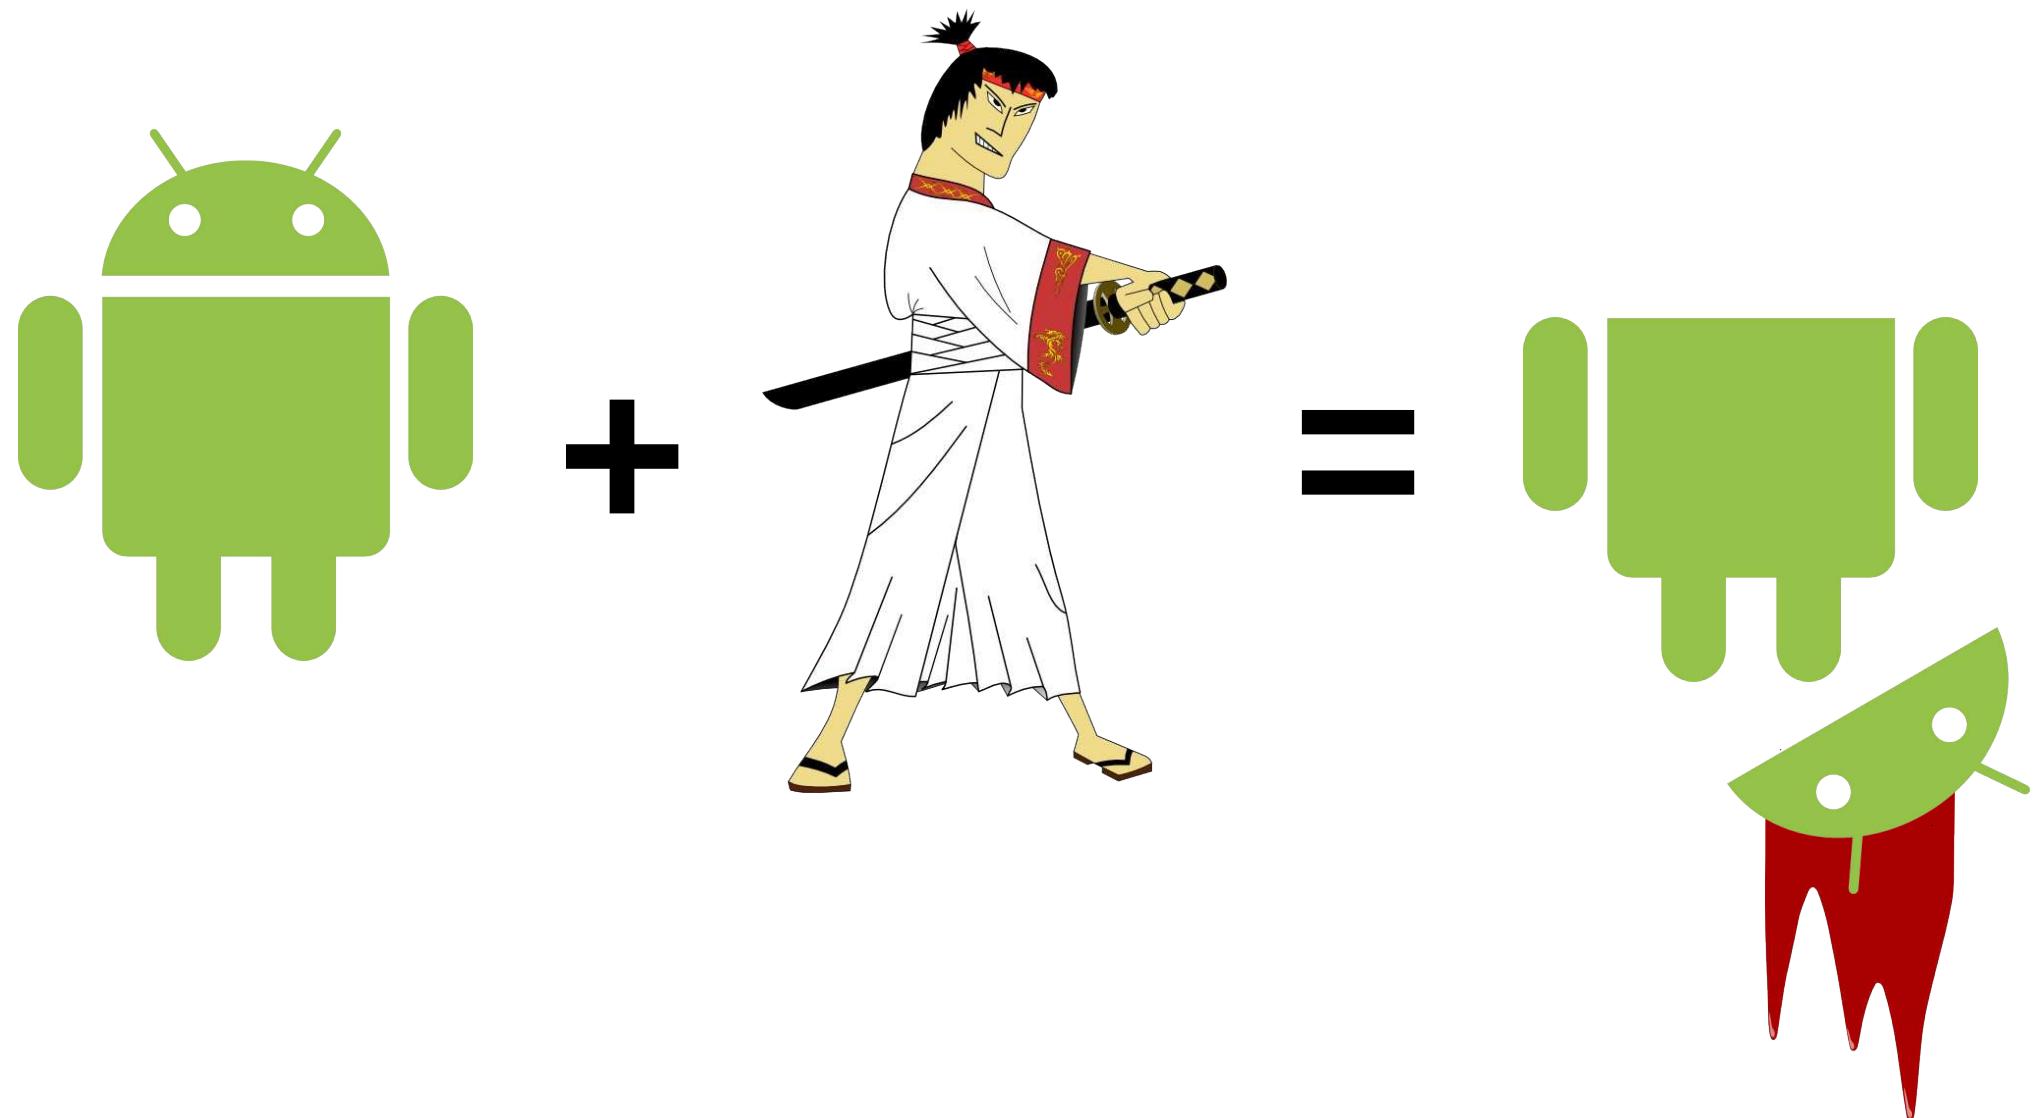

6. Melds

- Stock glibc stack (as covered earlier)

- Custom stacks

7. Headless Android

“And then GNU came back for revenge ...” -- Tarantino's sequel

7.1. Why?

- Took me a long time to wrap my *head* around
 - “Why don't you just use embedded Linux?”
- What's “Embedded Linux” anyway?
- NEW: Nexus Q

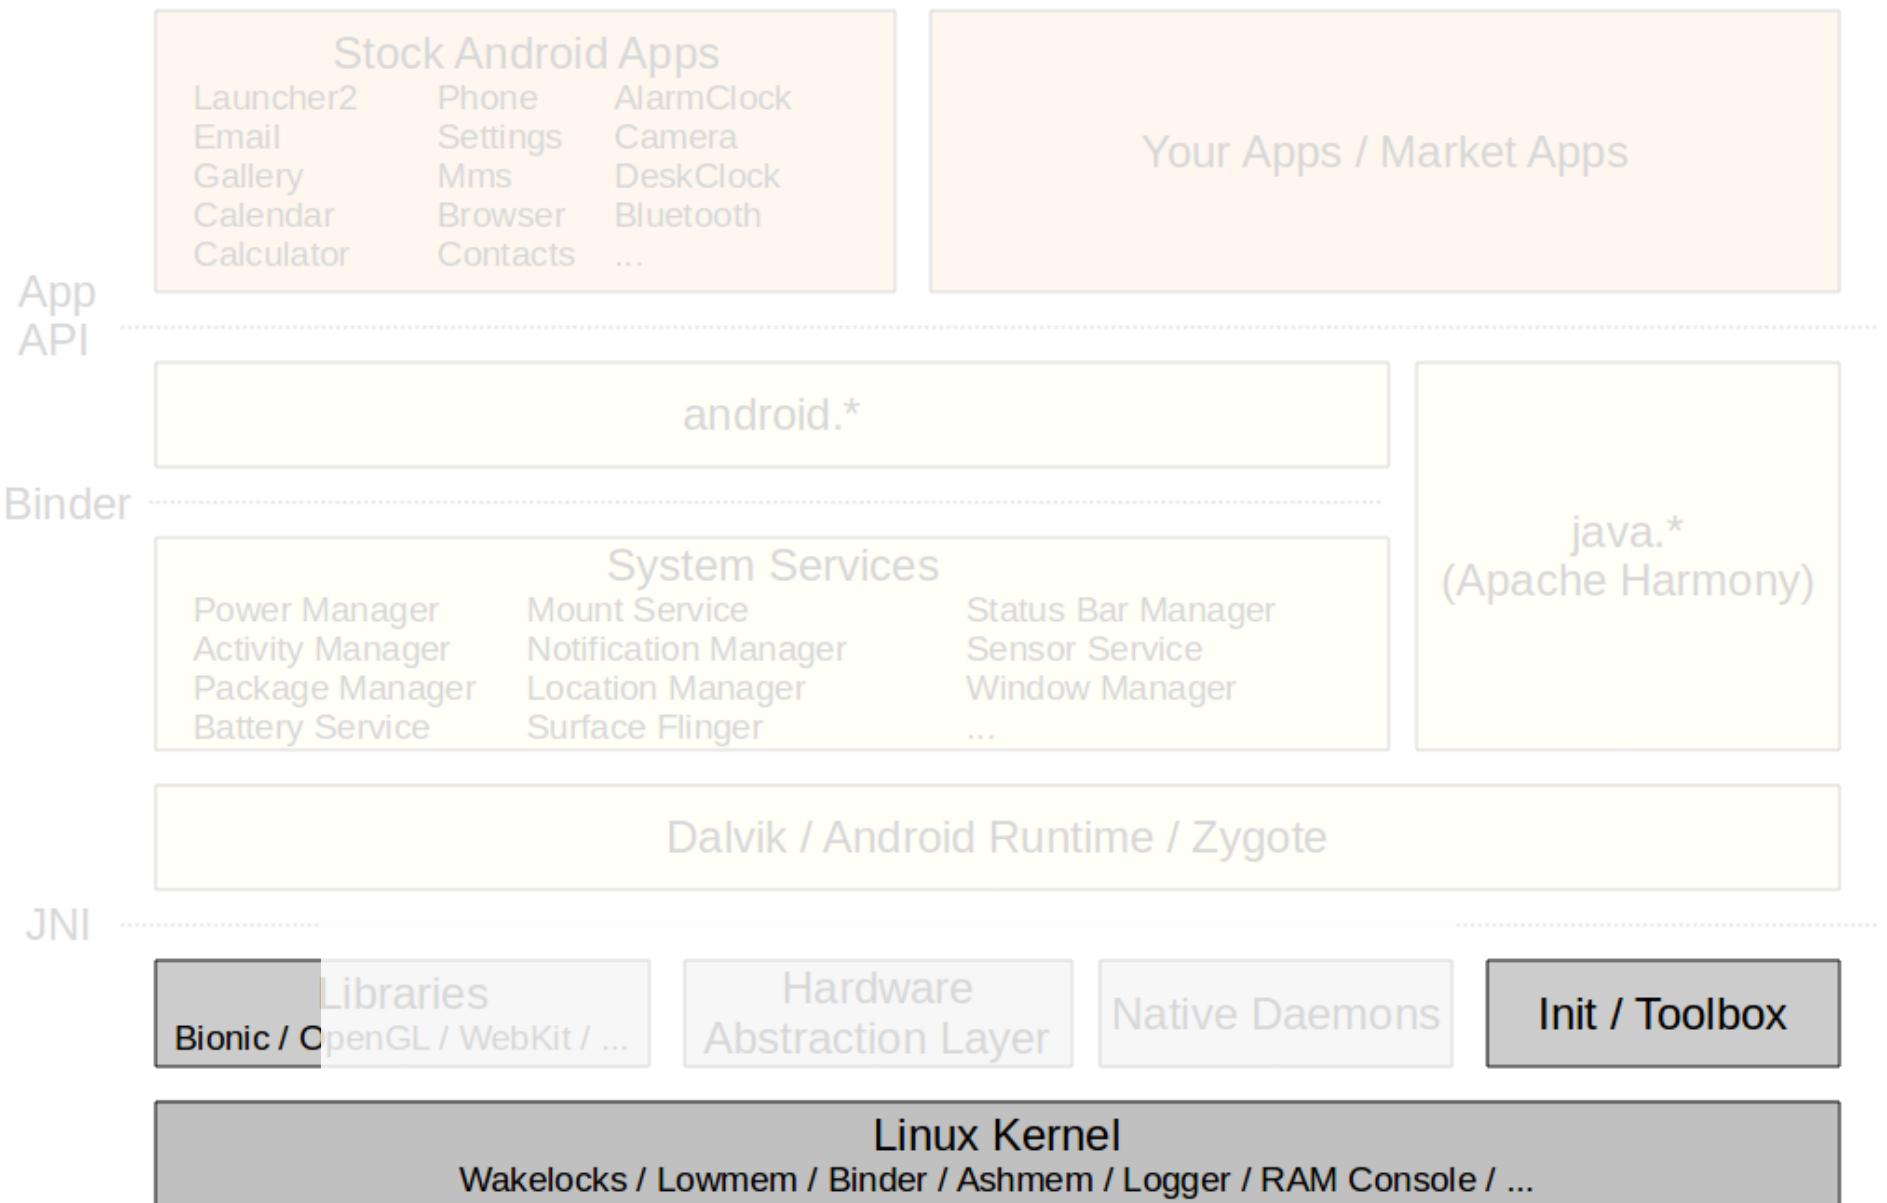

7.2. Possibilities

- No Java:
 - TinyAndroid:

```
$ BUILD_TINY_ANDROID=true make -j4
```
 - AOSP w/ custom products .mk file
- The full-blown stack without:
 - SurfaceFlinger
 - WindowManager
 - WallpaperService
 - InputMethodManager

7.3. Tiny Android

- 3MB filesystem
- Minimal root fs
- init
- toolbox + shell
- adb
- bionic + utility libs
- No “system/framework/”
- No “system/app”

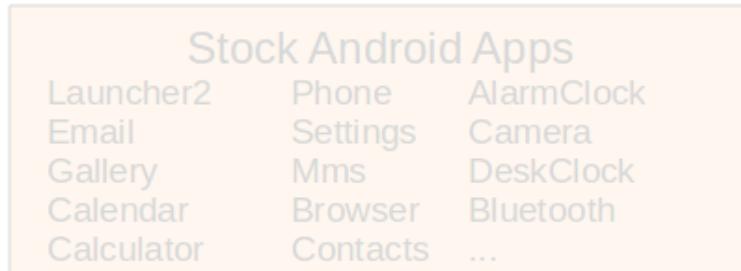

7.4. AOSP w/ custom product .mk

- Have a look at:
 - build/target/product/*.mk
- Create your own device under “/device” and have fun
- Disable zygote at startup
- Remove all apks
- ...

7.5. Full stack

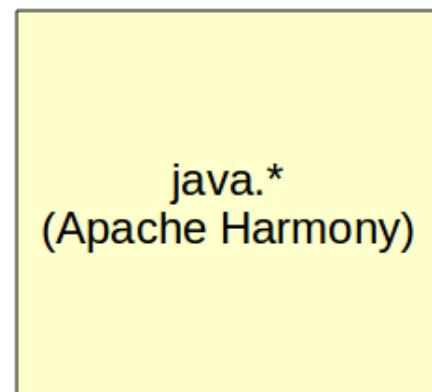

- Disable:
 - SurfaceFlinger
 - WindowManager
 - WallpaperService
 - InputMethodManager
 - SystemUI
- Don't let SurfaceFlinger Client try to open binder to SurfaceFlinger
- Feed bogus values back from SurfaceFlinger Client
- Disable qemud (emulator artefact)
- Tweak internals by disabling key calls:
 - In ActivityStack.java:
 - startHomeActivityLocked()
 - setAppStartingWindow()
 - wm.detectSafeMode()
 - wm.systemReady()
 - wm.reclaimSuraceMemoryLocked()

App API

Your Apps / Market Apps

Binder

JNI

Manipulating storage devices

- 1.MTD subsystem concepts
- 2.MTD usage basics
- 3.Native CFI flash
- 4.Disk devices
- 5.Swapping

1. MTD subsystem concepts

- MTD support for solid-state storage devices: flash, DOC, ROM, RAM, etc.
- 3 layers:
 - MTD chip drivers
 - MTD “glue logic”
 - MTD “user modules”
- Main MTD project URL:

<http://www.linux-mtd.infradead.org>

- Chip drivers:
 - NAND
 - OneNAND
 - CFI
 - NOR
 - RAM, ROM, and absent chips
 - Uncached RAM
 - Virtual devices for testing and evaluation
 - DiskOnChip (bit rot)

- “Mapping drivers” allow the MTD subsystem to locate and access the actual chips.
- When your chip is supported, you need to write the mapping driver for your board.
- MTD can manage multiple instances of a chip
- MTD can partition and concatenate devices
- User-modules provide additional functionality which allow chips to be accessed through the kernel's virtual filesystem layer.

- User-modules:
 - UBIFS:
 - Works on top of UBI (Unsorted Block Images), on top of MTD
 - UBI provides wear-leveling
 - Scalability
 - Fast mount, fast I/O, on-the-flight compression
 - Provides power-down reliability
 - YAFFS2
 - NAND flash
 - Includes wear-leveling
 - No compression
 - Provides power-down reliability (no fsck)

- JFFS2 (Journalling Flash File System version 2):
 - Implements log-structured FS on device
 - FS recreated in RAM at mount time
 - Includes wear-leveling
 - Implements data compression
 - Provides power-down reliability (no fsck)
- NFTL (NAND Flash Translation Layer) and INFNTL (Inverse NFTL) for M-Systems DiskOnChip devices
- FTL (Flash Translation Layer), part of PCMCIA std.

- Char device:
 - Provides direct access to chip as a char device
 - Very useful for programming device in Linux
- Caching block device:
 - Provides a simple block device interface to MTD devices
 - Can mount a block FS straight on it for reading & writing
 - Does NOT provide power-down reliability
 - Does NOT implement smart device management
- Read-only block device:
 - Same as caching block device, but read-only

2. MTD usage basics

- MTD subsystem developed independently from kernel.
- Recommended to use latest kernel
- Bleeding edge is in MTD git repo
- MTD subsystem requires /dev entries that differ from devices.txt file specification.
- MTD /dev entries are as listed in BELS table 7.1 and 7.2.

- Types of MTD /dev entries:
 - mtdN => each instance is separate MTD device or partition.
 - mtldrN => each instance is read-only copy of mtdN entry.
 - mtdblockN => each instance is block device copy of mtdN.
 - nftlN => each instance is separate NFTL device. Further numbered like hd.
 - ftlN => similar naming as nftlN
- If MTD devices are accessible on host, can use the packaged device creation script.

- Main MTD kernel configuration options:
 - Memory Technology Device (MTD) support:
Must be set to use MTD subsystem
 - MTD partitioning/concatenating support:
Enables partitioning/concatenating MTD devices
 - Direct char device access to MTD devices:
Required for accessing MTD devices as char devices
 - Caching block device access to MTD devices:
Enables mounting MTD device as normal rw block device
 - Read-only block device access to MTD devices:
Same as above, but read-only
 - FTL (Flash Translation Layer)
Provides FTL MTD user module
 - NFTL (NAND Flash Translation Layer)
Provides NFTL MTD user module

- INFTL (Inverse NAND Flash Translation Layer)
 - Provides INFTL MTD user module
- Can only set mtdblock or mtdblock_ro as built-in. Can set both as modules.
- Support for JFFS2 and JFFS is found in the “File Systems” submenu.
- MTD Submenus:
 - RAM/ROM/Flash chip drivers:
Support for CFI, JEDEC, non-CFI, RAM, ROM, etc.
 - Mapping drivers for chip access
Default mapping drivers for quite a few boards
 - Self-contained MTD device drivers
Uncached RAM, VM test drv, blk dev emu, DOC devices

- NAND Flash Device Drivers
 - NAND flash
- During development:
 - Build MTD options as modules
- For production:
 - Select MTD options as built-in
- MTD utilities:
 - MTD subsystem requires special tools (can't use conventional disk utilities.)
 - MTD utilities are very powerful. Be careful when using them, you could destroy your device.

- Generic tools:
 - `flash_info` => get erase information
 - `flash_erase` => erase device
 - `flash_eraseall` => erase entire device
 - `flash_unlock` => unlock flash protection
 - `flash_lock` => lock flash protection
 - `flashcp` => copy file to flash
 - `doc_loadbios` => copy bootloader to device
 - `mtd_debug` => access MTD debugging

- Filesystem creation tools:
 - `mkfs.jffs2` => create JFFS2 filesystem image
 - `mkfs.jffs` => create JFFS filesystem image
 - `jffs2dump` => dumps the content of a JFFS2 image (can't mount JFFS2 on loopback.)
- NFTL tools:
 - `nftl_format` => write NFTL format on device
 - `nftldump` => dump NFTL content to file
- FTL tools:
 - `ftl_format` => write FTL format on device
 - `ftl_check` => verify FTL format

- NAND chip tools
 - nandwrite => write to NAND device
 - nandtest => test NAND device
 - nandump => dump NAND device content
- Installing MTD tools on host:
 - Get and put in \${PRJROOT}/build-tools:
 - Zlib: <http://www.zlib.net>
 - LZO: <http://www.oberhumer.com/opensource/lzo/>
 - Libacl: <http://oss.sgi.com/projects/xfs/>
 - MTD: <git://git.infradead.org/mtd-utils>
 - Make sure you have LZO And UUID installed:

```
$ sudo apt-get install liblzo2-dev
$ sudo apt-get install uuid-dev
```

- Installing MTD tools for target:
 - Configure and compile zlib:

```
$ cd ${PRJROOT}/build-tools/  
$ tar xvzf zlib-1.2.5.tar.gz  
$ zlib-1.2.5  
$ CC=${TARGET}-gcc \  
> LDSHARED="${TARGET}-ld -shared" \  
> ./configure --shared  
$ make  
$ make prefix=${TARGET_PREFIX} install
```

- Configure and compile lzo:

```
$ cd ${PRJROOT}/build-tools/  
$ tar xvzf lzo-2.03.tar.gz  
$ cd lzo-2.03  
$ CC=powerpc-unknown-linux-gnu-gcc ./configure \  
> --enable-shared --host=i686-linux \  
> --target=powerpc-unknown-linux-gnu  
$ make  
$ make prefix=${TARGET_PREFIX} install
```

- Got to \${PRJROOT}/build-tools

- Extract git snapshot:

```
$ git clone git://git.infradead.org/mtd-utils
```

- Copy the acl.h header:

```
$ cd ${PRJROOT}/build-tools  
$ tar xvzf acl_2.2.47-1.tar.gz  
$ mkdir ${PRJROOT}/mtd-utils/include/sys  
$ acl-2.2.47/include/acl.h \  
 > ${PRJROOT}/mtd-utils/include/sys
```

- Go to mtd-utils/ and build tools:

```
$ make
```

- Install tools:

```
$ make DESTDIR=${PREFIX} SBINDIR="" install
```

3. Native CFI flash

- Relatively straight-forward
- Kernel configuration:
 - Memory Technology Device (MTD) support
 - MTD partitioning/contactenating support, if needed
 - Direct char access to MTD devices
 - Caching block device access to MTD devices
 - “RAM/ROM/...” submenu: Detect flash chip by Common Flash Interface (CFI) and Support for Intel/Sharp and AMD/Fujitsu flash chips.
 - “Mapping drivers ...” submenu: select CFI mapping for board

- Partitioning can be done in mapping driver
- Newer partitioning method using boot param:

```
mtdparts=0:256k(ppcboot)ro,768k(kernel),1m(user),-(initrd);  
1:2m(cramfs),-(jffs2)
```

- For TQM860L, partition is as follows:

TQM flash bank 0: Using static image partition definition

Creating 4 MTD partitions on "TQM8xxL Bank 0":

```
0x00000000-0x00040000 : "ppcboot"
```

```
0x00040000-0x00100000 : "kernel"
```

```
0x00100000-0x00200000 : "user"
```

```
0x00200000-0x00400000 : "initrd"
```

TQM flash bank 1: Using static file system partition definition

Creating 2 MTD partitions on "TQM8xxL Bank 1":

```
0x00000000-0x00200000 : "cramfs"
```

```
0x00200000-0x00400000 : "jffs2"
```

- Partitions are on erase block boundaries (128KB)

- Creation of necessary /dev entries:

```
$ cd ${PRJROOT}/rootfs/dev
$ su -m
Password:
# for i in $(seq 0 5)
> do
> mknod mtd$i c 90 $(expr $i + $i)
> mknod mtblock$i b 31 $i
> done
# exit
$ ls -al mtd*
crw-rw-r-- 1 root root 90, 0 Jun 25 17:19 mtd0

crw-rw-r-- 1 root root 90, 4 Jun 25 17:20 mtd2
crw-rw-r-- 1 root root 90, 6 Jun 25 17:20 mtd3
crw-rw-r-- 1 root root 90, 8 Jun 25 17:20 mtd4
crw-rw-r-- 1 root root 90,10 Jun 25 17:20 mtd5
brw-rw-r-- 1 root root 31, 0 Jun 25 17:17 mtblock0
brw-rw-r-- 1 root root 31, 1 Jun 25 17:17 mtblock1
brw-rw-r-- 1 root root 31, 2 Jun 25 17:17 mtblock2
...
...
```

- Must erase flash before writing:

```
# flash_eraseall /dev/mtd3  
Erased 2048 Kibyte @ 0 -- 100% complete.
```

- Writing:

```
# cat /tmp/initrd.bin > /dev/mtd3
```

- Reading:

```
# dd if=/dev/mtd0 of=/tmp/u-boot.img
```

4. Disk devices

- There is a lot of documentation on how to manipulate disk devices in Linux.
- Main tool: `fdisk`

```
# fdisk
Command (m for help): m
Command action
  a  toggle a bootable flag
  b  edit bsd disklabel
  c  toggle the dos compatibility flag
  d  delete a partition
  l  list known partition types
  m  print this menu
  n  add a new partition
  o  create a new empty DOS partition table
  p  print the partition table
  q  quit without saving changes
  s  create a new empty Sun disklabel
  t  change a partition's system id
  u  change display/entry units
  v  verify the partition table
  w  write table to disk and exit
  x  extra functionality (experts only)
```

- Once partitions are created, use the `mkfs` utility described earlier to create a filesystem type on the device and use `mount` to mount new filesystem.
- If need be, use LILO as described earlier to install bootloader on secondary hard-disk.

5. Swapping

- Discouraged for all types of embedded Linux systems, except large ones.
- Strongly discourage for any system relying on solid-state storage.
- Use `swapon` to enable swapping on a device and `swapoff` to disable swapping on a device.

Choosing and installing the rootfs

1. Selecting a filesystem
2. Writing images to flash using NFS
3. CRAMFS
4. ROMFS
5. Squashfs
6. UBIFS
7. JFFS2
8. Disk filesystem over RAM disk
9. Comparing filesystem image size
10. TMPFS
11. Live updates

1. Selecting a filesystem

- Important part of system design
- Requires understanding of filesystem capabilities and system's dynamics.
- Filesystem characteristics:
 - Write
 - Persistent
 - Power down reliability
 - Compression
 - Lives in RAM

- Selecting a filesystem:
 - RAM disk:
 - Large amount of RAM
 - Limited amount of flash
 - Don't need to keep changes across reboots
 - For persistence, use with additional filesystem
 - Easiest way to get self-hosting target
 - Replaced by initramfs
 - CRAMFS
 - Compressed ROM filesystem
 - Requires less RAM than a RAM disk
 - Cannot be written to (read-only)

- Maximum file-size of 16 MB
 - No current or parent directories
 - 16-bit UID / 8-bit GID
 - All timestamps set to Epoch
 - All files have link count of 1
 - Requires block device
- ROMFS
 - ... read-only
 - Requires block device
 - Stores the bare-minimum details required for a filesystem
 - Does not store: dates, permissions
 - Used to be used by uClinux since no protection anyway
 - No compression

- Squashfs:
 - Compressed ROM filesystem, better than CRAMFS
 - Requires block device
- UBIFS:
 - JFFS2-replacement
 - All benefits of JFFS2 w/ better performance and scalability
 - Benefits most apparent on large images
- JFFS2
 - Compressed
 - Read / write
 - Perfect for devices that need field-updating
 - Power-down reliability (no roll-back)
 - Wear-leveling

- Using a regular disk device:
 - Have a look at the slew of disk filesystems supported by Linux. BELS contains a few pointers if you're out of inspiration.

2. Writing images to flash using NFS

- May not have access to flash device from host, but may need to put image generated on host in target flash.
- Steps:
 1. Generate image on host
 2. Cross-build MTD utilities for target and install in \${PRJROOT}/rootfs
 3. Mount target's rootfs using NFS
 4. On host, copy image to directory mounted by target as rootfs.
 5. Use MTD utilities to copy image from rootfs to appropriate /dev entry.

3. CRAMFS

- Latest available from:
<http://sourceforge.net/projects/cramfs/>
- Download CRAMFS (1.1) utilities into your \${PRJROOT}/build-tools directory and uncompress there.
- Build and install CRAMFS utilities:

```
$ cd ${PRJROOT}/build-tools/cramfs-1.1  
$ make  
$ cp cramfsck mkcramfs ${PREFIX}/bin/
```

- Creating a rootfs image:

```
$ cd ${PRJROOT}  
$ mkcramfs rootfs/ images/cramfs.img  
Directory data: 3960 bytes  
Everything: 3452 kilobytes  
Super block: 76 bytes  
CRC: f74fb18c  
warning: gids truncated to 8 bits (this may be a security concern)
```

- Example filesystem image writing to device, if MTD device accessible on host:

```
$ su -m  
Password:  
# cat images/cramfs.img > /dev/mtd5  
# exit
```

- Use NFS-writing if device not accessible from host

4. ROMFS

- Latest available from: <http://romfs.sourceforge.net/>
- Download genromfs (0.5.2) utilities into your \${PRJROOT}/build-tools directory and uncompress there.
- Build and install genromfs utilities:

```
$ cd ${PRJROOT}/build-tools/genromfs-0.5.2  
$ make  
$ cp genromfs ${PREFIX}/bin
```

- Creating a ROMFS image:

```
$ cd ${PRJROOT}  
$ su -m  
# genromfs -d rootfs/ -f images/romfs.img  
# chown karim:karim images/romfs.img
```

5. Squashfs

- Latest available from: <http://www.squashfs.org>
- Download squashfs (4.1) into your \${PRJROOT}/build-tools directory and uncompress there.
- Make sure you have libacl1-dev installed:

```
$ sudo apt-get install libacl1-dev
```

- Build and install genromfs utilities:

```
$ cd ${PRJROOT}/build-tools/squashfs4.1  
$ make  
$ cp mksquashfs unsquashfs ${PREFIX}/bin
```

- Creating a SquashFS image:

```
$ cd ${PRJROOT}  
$ mksquashfs rootfs/ images/squashfs.img
```

6. UBIFS

- Tools already installed as part of MTD utilities
- Creating a UBIFS image:

```
$ cd ${PRJROOT}  
$ mkfs.ubifs -m 512 -e 128KiB -c 100 -x zlib \  
> -r rootfs images/ubifs.img
```

7. JFFS2

- Tools already installed as part of MTD utilities.
- Creating a JFFS2 image:

```
$ cd ${PRJROOT}  
$ mkfs.jffs2 -r rootfs/ -o images/jffs2.img
```

- Can't mount on loopback
- May use jffs2dump

8. Disk filesystem over RAM disk

- RAM disks behave like block devices
- The RAM disk driver can manage multiple RAM disk instances.
- initrd is mechanism to provide kernel with initial RAM disk for use as rootfs at startup.
- Creating blank filesystem image:

```
$ cd ${PRJROOT}
$ mkdir tmp/initrd
$ dd if=/dev/zero of=images/initrd.img bs=1k count=8192
8192+0 records in
8192+0 records out
8388608 bytes (8.4 MB) copied, 0.0425007 s, 197 MB/s
```

- Formating filesystem image and mounting it:

```
$ su -m
Password:
# /sbin/mke2fs -F -v -m0 images/initrd.img
mke2fs 1.41.12 (17-May-2010)
fs_types for mke2fs.conf resolution: 'ext2', 'small'
Calling BLKDISCARD from 0 to 8388608 failed.
Filesystem label=
OS type: Linux
Block size=1024 (log=0)
Fragment size=1024 (log=0)
Stride=0 blocks, Stripe width=0 blocks
2048 inodes, 8192 blocks
0 blocks (0.00%) reserved for the super user
First data block=1
Maximum filesystem blocks=8388608
1 block group
8192 blocks per group, 8192 fragments per group
2048 inodes per group
...

```

```
# mount -o loop images/initrd.img tmp/initrd
```

- Copying rootfs, umounting, and compressing:

```
# cp -av rootfs/* tmp/initrd  
`rootfs/bin' -> `tmp/initrd/bin'  
`rootfs/bin/busybox' -> `tmp/initrd/bin/busybox'  
`rootfs/bin/ash' -> `tmp/initrd/bin/ash'  
`rootfs/bin/cat' -> `tmp/initrd/bin/cat'  
`rootfs/bin/chgrp' -> `tmp/initrd/bin/chgrp'  
`rootfs/bin/chmod' -> `tmp/initrd/bin/chmod'  
...  
# umount tmp/initrd  
# exit  
$ gzip -9 < images/initrd.img > images/initrd.bin
```

- The initrd mechanism is largely favored to be replaced by initramfs.

9. Disk filesystem over initramfs

- Initramfs used by kernel at boot time
- Can be linked directly into kernel image
- Creating an initramfs image:

```
$ cd ${PRJROOT}/rootfs  
$ find . | cpio -o -H newc | gzip > ../images/initramfs.img
```

10. Comparing filesystem image sizes

- Let's take a look at what we've generate so far:

```
$ cd ${PRJROOT}/images
$ ls -al \
> cramfs.img romfs.img squashfs.img ubifs.img jffs2.img init*
-rw-r--r-- 1 stage stage 3719168 2011-02-25 14:49 cramfs.img
-rw-r--r-- 1 stage stage 3492683 2011-02-25 11:28 initramfs.img
-rw-r--r-- 1 stage stage 8388608 2011-02-25 15:19 initrd.img
-rw-r--r-- 1 stage stage 4237296 2011-02-25 15:13 jffs2.img
-rw-r--r-- 1 stage stage 6949888 2011-02-25 14:50 romfs.img
-rw-r--r-- 1 stage stage 3264512 2011-02-25 14:58 squashfs.img
-rw-r--r-- 1 stage stage 5898240 2011-02-25 15:13 ubifs.img
```

11. Mounting directories on TMPFS

- Dynamically resizable RAM-based FS
- Perfect for holding transient data
- No need to create beforehand or format
- Mount:

```
# mount -t tmpfs none /tmp -o size=4m
```

12. Live updates

- Only RAM disks can be replaced in its entirety while mounted.
- CRAMFS, ROMFS, Squashfs cannot be replaced
- All rootfses based on other filesystems must be updated while mounted by modifying files and directories one-by-one.
- Four main ways:
 - rsync
 - Package management tools
 - netflash
 - Ad hoc scripts

- The `rsync` utility:
 - Replaces Unix's `rccp`
 - Allows network update
 - Can be used over SSH
 - Available from: <http://samba.anu.edu.au/rsync/>
 - Need to have daemon running on host and client running in the embedded system.
 - `rsync` most likely already installed by distro.
 - Download (2.5.6) and extract package in your `${PRJROOT}/sysapps` directory.

- Configure compile and install rsync:

```
$ cd ${PRJROOT}/sysapps/rsync-2.5.6/  
$ CC=powerpc-linux-gcc \  
> CPPFLAGS="-DHAVE_GETTIMEOFDAY_TZ=1" ./configure \  
> --host=$TARGET --prefix=${TARGET_PREFIX}  
$ make  
$ cp rsync ${PRJROOT}/rootfs/bin  
$ powerpc-linux-strip ${PRJROOT}/rootfs/bin/rsync
```

- Use on target:

```
# rsync -e "ssh -l root" -r -l -p -t -D -v \  
> --progress \  
> 192.168.172.100:/home/karim/example-sys/rootfs/* /
```

- To do a dry run, add “-n” parameter

- Package management tools:
 - dpkg
 - RPM
 - BusyBox dpkg
- The netflash utility:
 - Part of uClinux-dist

Kernel internals

- 1.Brief history
- 2.Features
- 3.General architecture
- 4.Source layout
- 5.Process management
- 6.Filesystems
- 7.Memory management
- 8.Communication facilities and interfacing
- 9.Loadable modules

- 10. Interrupt and exception management
- 11. Timing
- 12. Locking primitives
- 13. Kernel startup
- 14. Dealing with kernel failure

1. Brief history

- Started on Minix by Linus Torvalds (who wanted to call it Freax ...)
- Rechristened “Linux” by FTP site admin
- Once public, users and contributions grew at a very rapid rate.
- Closed the GNU project's loop
- Most important events:
 - 17 September 1991: Version 0.01
 - 3 December 1991: Version 0.10
 - 8 March 1992: Version 0.95

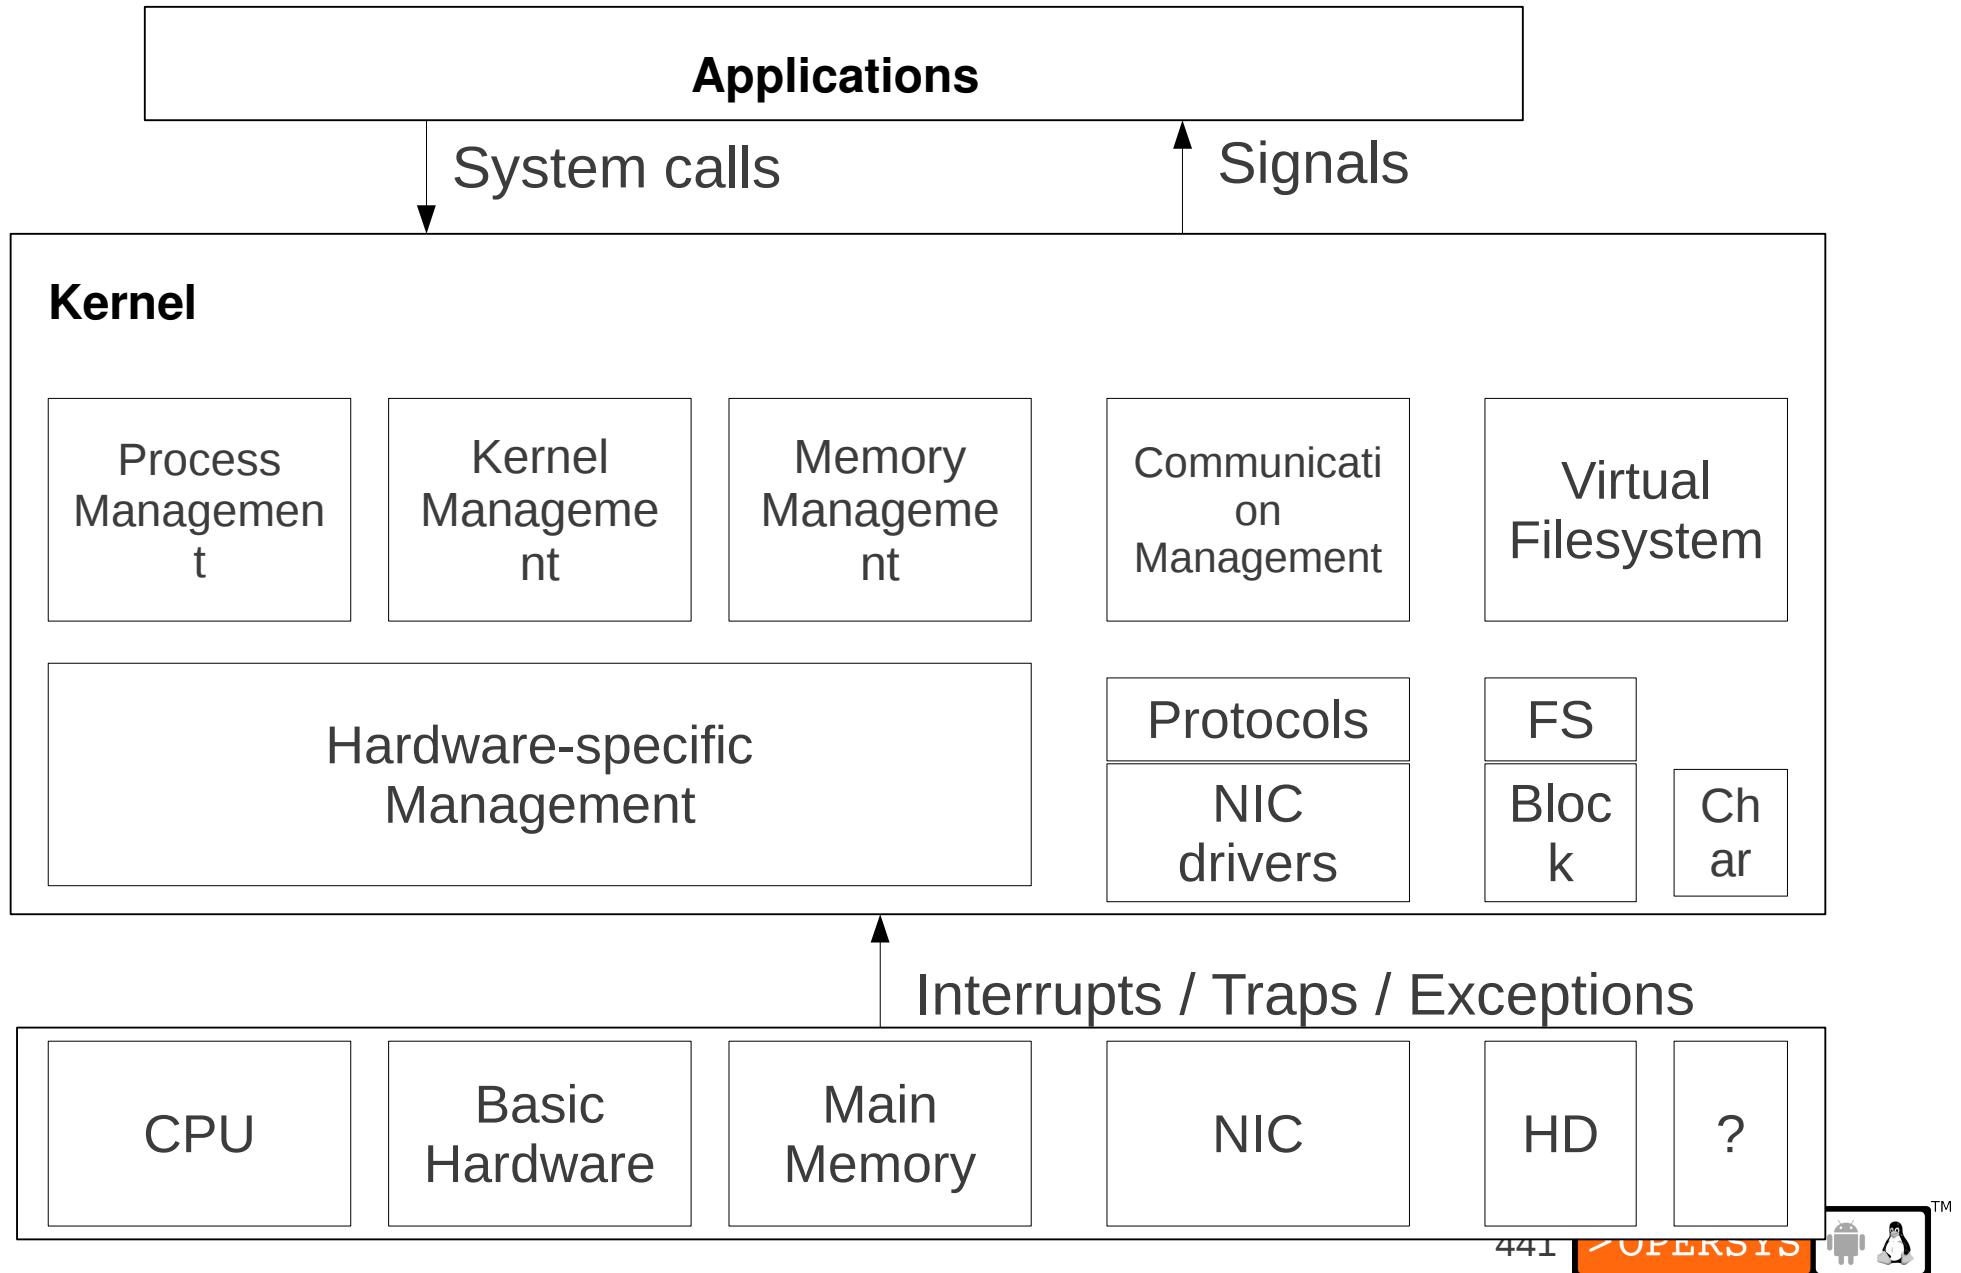

- 13 December 1992: Version 0.99
- 13 March 1994: Version 1.0
- 7 March 1995: Version 1.2.0
- 9 July 1996: Version 2.0
- 26 January 1999: Version 2.2.0
- 4 January 2001 : Version 2.4.0
- 17 December 2003: Version 2.6.0
- 21 July 2011: Version 3.0.0

2. Features

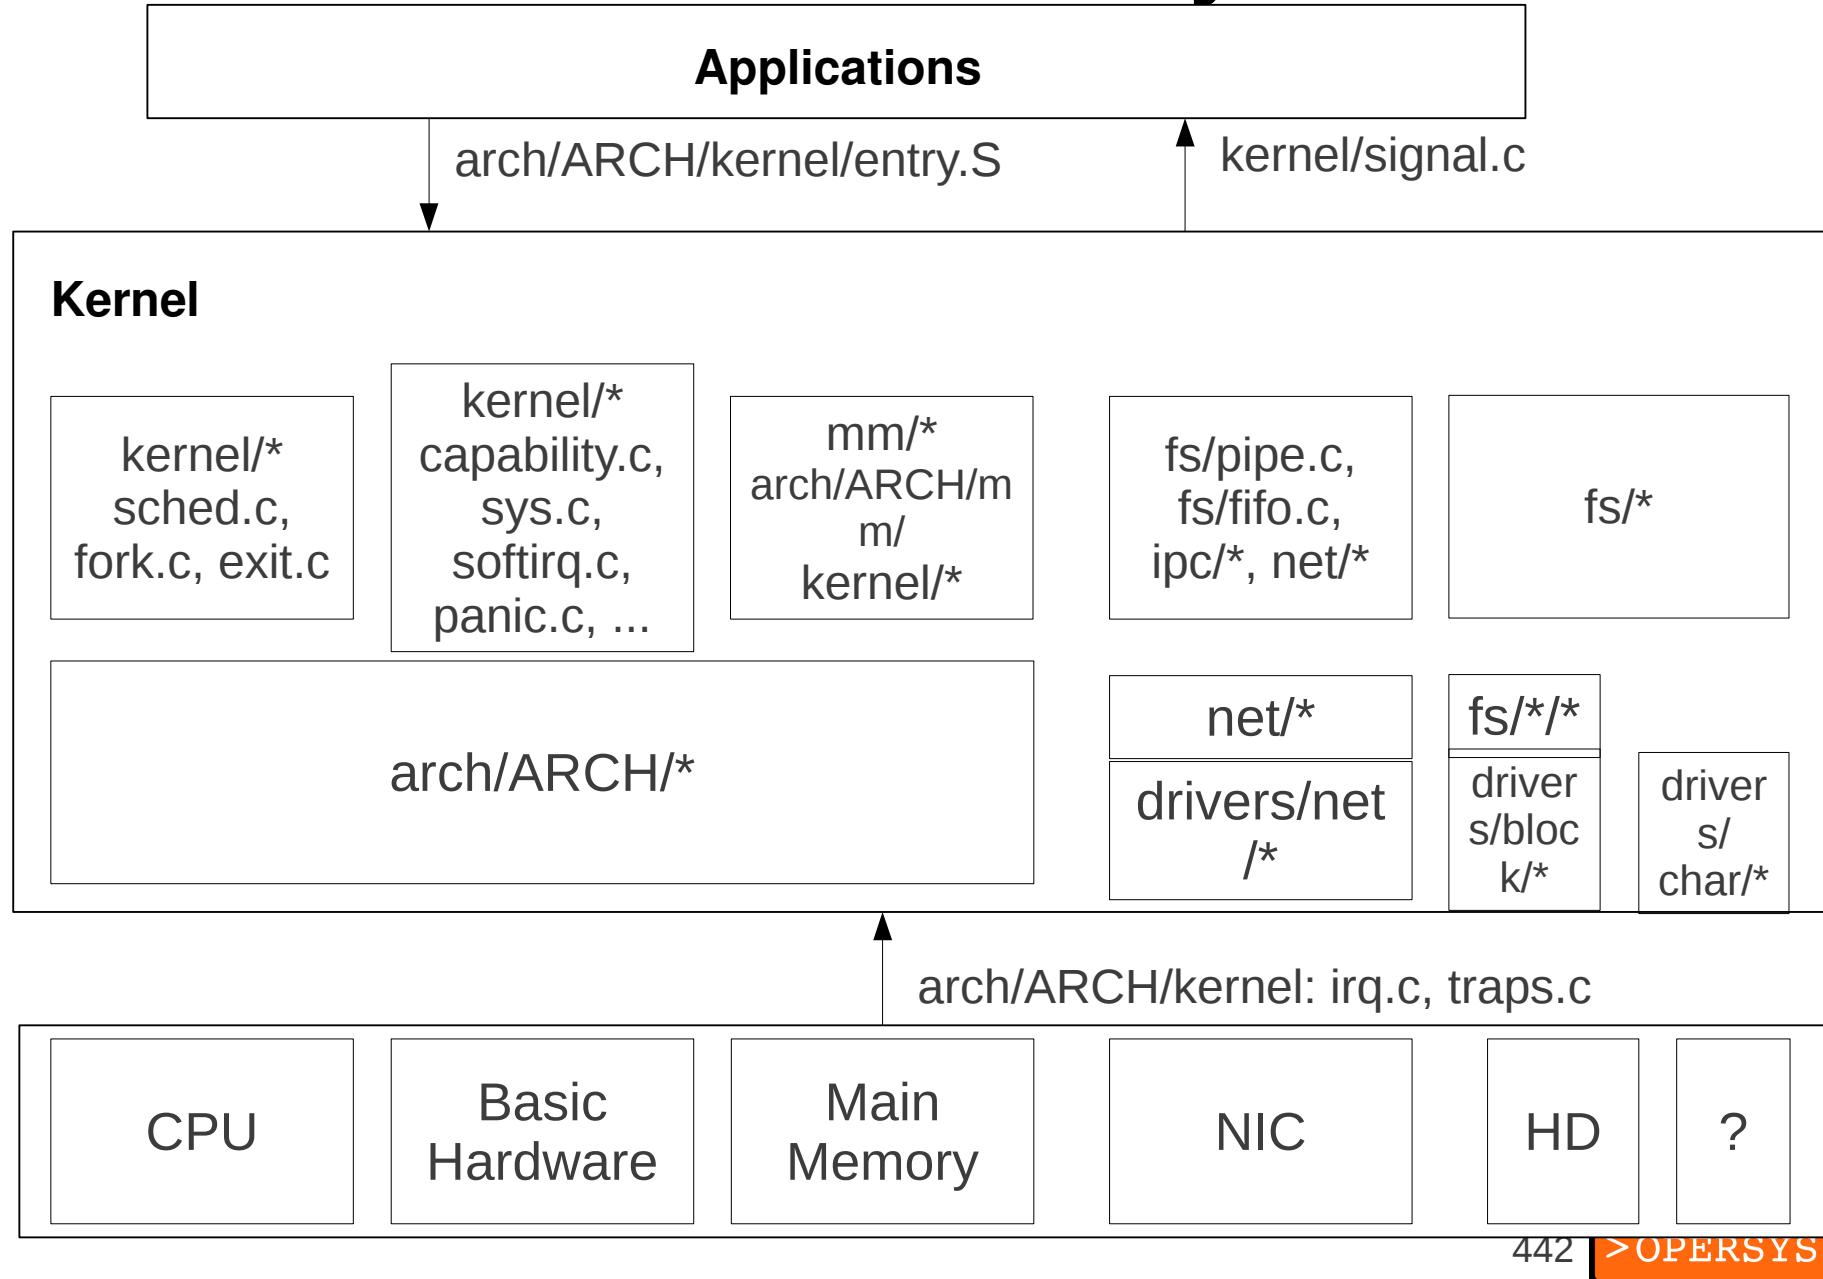

- Portable / Architecture-independent
- Scalable
- Monolithic
- Dynamically extensible (modules)
- Multi-user environment
- Multi-process / Multi-threading
- Memory protection
- Preemptable (starting in 2.5.x) ... but not real-time
- Symmetric multi-processor

- Slew of filesystems
- Slew of networking protocols / NICs
- Quite a few executable formats
- ...

3. General architecture

4. Source layout

arch	112MB =>	architecture-dependent functionality
block	600KB =>	block layer
Documentation	17MB =>	main kernel documentation
drivers	231MB =>	all drivers
fs	31MB =>	virtual filesystem and all fs types
include	20MB =>	complete kernel headers
init	150KB =>	kernel startup code
ipc	224KB =>	System V IPC
kernel	4.7MB =>	core kernel code
mm	2.2MB =>	memory management
net	20MB =>	networking core and protocols
scripts	1.1MB =>	scripts used to build kernel
tools	2.1MB =>	misc. kernel-related tools

- **arch/**

2.4M	alpha	11M	mips

```

- Looking for something:
 - Try grep
 - Have a look at the Linux Cross-Referencing project:
 - URL: <http://lxr.linux.no/>
 - Code: <http://lxr.sourceforge.net/>
 - Advanced kernel searching/understanding:
 - CScope: <http://cscope.sourceforge.net/>
 - KScope front-end: <http://kscope.sourceforge.net/>
 - ETAGS (emacs)

5. Process management

- Process descriptor (include/linux/sched.h: `task_struct`):

Process state	=>	<i>state</i>
Identification	=>	<i>pid, tgid</i>
Relationship	=>	<i>*parent, children</i>
Scheduling	=>	<i>time_slice, sched_class,</i> <i>rt_priority, prio, static_prio</i>
Files	=>	<i>*files</i>
Memory	=>	<i>*mm</i>

- Main process list:
 - Doubly-linked list
 - List head: *init_task*
- Currently running process (macro): *current*
- Task creation:
kernel/fork.c:do_fork()
- Threads:
arch/ARCH/kernel/process.c:sys_clone()
- *sys_clone()* ends up calling *do_fork()*

- Scheduling:
 - Process states: TASK_RUNNING, TASK_INTERRUPTIBLE, TASK_UNINTERRUPTIBLE, TASK_STOPPED, TASK_TRACED, EXIT_ZOMBIE, ...
 - Main scheduling function:
kernel/sched.c: *schedule()*
 - Scheduling policies:
 - SCED_NORMAL
 - Main scheduling policy for Linux processes
 - SCED_FIFO:
 - Process has CPU until it gives it up or no other higher priority task comes along.
 - SCED_RR:
 - CPU is shared between “real-time” tasks
 - ...

- Address space:
 - `include/linux/mm_types.h:mm_struct`
 - Fields: `*mmap, mm_count, start_code, end_code, start_data, end_data, start_brk, brk, start_stack, arg_start, arg_end, env_start, env_end`
- Special tasks:
 - `init` => first process on system
 - `ksoftirqd/0` => soft-irq thread for avoiding process starvation
 - `events/0` => kernel's work queue handler (was keventd)
 - `khubd` => USB hub thread
 - `kswapd0` => pageout daemon

6. Filesystems

- Virtual filesystem: fs/*

attr.c	=>	file attributes
block_dev.c	=>	block device access
buffer.c	=>	buffer cache
char_dev.c	=>	char device access
dcache.c	=>	dentry (directory entry) cache
notify/	=>	directory change notifications
quot/	=>	disk quota
exec.c	=>	<i>exec()</i> and its variants
fcntl.c	=>	<i>fcntl()</i>
fifo.c	=>	FIFO handling
file.c	=>	manage process' fd array
file_table.c	=>	file table manipulation
inode.c	=>	inode handling
ioctl.c	=>	<i>ioctl()</i>
locks.c	=>	file locking

namei.c	=>	pathname lookup
namespace.c	=>	filesystem mounting
open.c	=>	<i>open()</i>
pipe.c	=>	pipe management
readdir.c	=>	directory reading
read_write.c	=>	<i>read()</i> and <i>write()</i> , and variants
select.c	=>	<i>select()</i> and <i>poll()</i>
stat.c	=>	<i>stat()</i>
super.c	=>	filesystem type management

- Root filesystem mounting: `init/do_mounts.c`
`prepare_namespace()`
- RAM disk handling (within `init/`):
 - `do_mounts_initrd.c`: `initrd_load()`
 - `do_mounts_rd.c`: `rd_load_image()`, `identify_ramdisk_image()`
 - `do_mounts_initrd.c`: `handle_initrd()`,

7. Memory management

- Arch-independent portion: mm/*

bootmem.c	=>	boot memory allocation / handling
filemap.c	=>	handling for <i>mmap()</i> 'ed files
highmem.c	=>	RAM above 896MB / up to 64 GB
memory.c	=>	page and page table manipulation
mlock.c	=>	memory region locking
mmap.c	=>	<i>mmap()</i>
mprotect.c	=>	memory protection mechanisms
mremap.c	=>	<i>mremap()</i>
<i>nommu.c</i> (2.5)	=>	<i>functions for MMU-less processors</i>
oom_kill.c	=>	process killing when short on memory
page_alloc.c	=>	page allocation / freeing
page_io.c	=>	reading / writing swap pages
shmem.c	=>	shared memory management
slab.c	=>	memory allocation for kernel
swap.c	=>	swap default

- swapfile.c => swap space management
 - swap_state.c => swap page caching
 - vmalloc.c => memory region allocation
 - vmscan.c => page out daemon
-
- Architecture-dependent portion: arch/ARCH/mm/*
 - fault.c all => page fault handler
 - init.c all => memory initialization
 - ioremap.c x86=> remapping of I/O range to kernel space
 - pageattr.c x86=> page attributes handling
 - pgtable.c ppc=> page table manipulation
 - ppc_mmu.c ppc=> MMU handling for PPC
 - tlb.c ppc=> TLB flushing

8. Communication facilities and interfacing

- Signals => kernel/signal.c
- Pipes => fs/pipe.c
- FIFOs => fs/fifo.c
- Sockets => net/socket.c
- System V IPC => ipc/ : msg.c, sem.c, shm.c
- System calls => arch/ARCH/kernel/entry.S
- Adding new system calls:
 - 1.Add entry to arch/ARCH/kernel/entry.S
 - 2.Add entry to arch/ARCH/include/unistd.h
 - 3.Add your function to the kernel's code

9. Loadable modules

- Allow dynamic loading and unloading of additional kernel functionality.
- Managed by: `kernel/module.c`
- In practice, modules are `.ko` files (`.o` prior to 2.6)
- A single module's source tree can have a very complex hierarchy.
- Every module must export functions using:

module_init() => called on insmod

module_exit() => called on rmmod

- Module macros:

MODULE_AUTHOR	=> module's author
MODULE_LICENSE	=> module's license (taint)
MODULE_DESCRIPTION	=> module's description
EXPORT_SYMBOL	=> export symbol for use by other modules
MODULE_PARM_DESC	=> module parameter description

...

- Requesting modules from within the kernel:

*int request_module(const char * name, ...)*

10. Interrupt and exception management

- Relevant files:
 - arch/x86/kernel/
 - i8259.c => initialization and handling of 8259
 - irq.c => arch-dependent irq handling
 - entry.S => main assembly entry point
 - traps.c => CPU exception handling
 - kernel/irq/
 - handle.c => arch-independent irq handling (exc. ARM)
- Exception examples:
 - debug, overflow, bounds, fp, fault, nmi, etc.
- Exceptions path:
 1. arch/x86/kernel/entry.S: hard-coded assembly
 2. arch/x86/kernel/traps.c: custom function or macro generated (DO_ERROR).

- Hardware interrupt code:
 - arch/x86/kernel/entry.S: irq_entries_start
- Hardware interrupt path:
 1. Assembly in entry.S
 2. *do_IRQ()* in arch/x86/kernel/irq.c
 3. *__do_IRQ()* in kernel/irq/handle.c:
 1. Acknowledges IRQ using callback from arch/x86/kernel/i8259.c: *mask_and_ack_8259A()*
 2. Calls *handle_IRQ_event()*
 4. Handler provided by device driver is invoked

- Deferring handling with enabled interrupts:
 - Softirq:
 - Statically allocated
 - Reentrant (must use locking mechanisms to protect data)
 - Softirqs of same type can run on many CPUs in the same time.
 - Tasklets:
 - Built on top of softirqs
 - Dynamically allocatable
 - The same tasklet type can't run on 2 CPUs in the same time.
 - Bottom-halves:
 - Built on top of tasklets
 - Statically allocated
 - There can only be one BH running at one time in the entire system.

11. Timing

- Time-keeping variables in the kernel: x86

<i>jiffies</i>	=>	incremented at every clock tick
<i>wall_jiffies</i>	=>	last time xtime was updated
TSC	=>	CPU-maintained counter (64-bit)

- Time handling:
 - arch/x86/kernel/time.c
- Finding out what time it is:
 - *do_gettimeofday()*
 - *get_cycles()*
 - *jiffies*

12. Locking primitives

- Never do cli / sti
- Always use existing locks to do the dirty-work
- Variants:
 - Spinlocks with IRQ disabling: good for int handlers

```
spin_lock_irqsave(&lock_var, cpu_flags);  
....  
spin_unlock_irqrestore(&lock_var, cpu_flags);
```
 - Vanilla spinlocks: good for most code not in int

```
spin_lock(&lock_var);
```

```
....
```

```
spin_unlock(&lock_var);
```

- Read/write locks:

- In reader:

```
read_lock_irqsave(&lock_var, cpu_flags);
```

```
....
```

```
read_unlock_irqrestore(&lock_var, cpu_flags);
```

- In writer:

```
write_lock_irqsave(&lock_var, cpu_flags);
```

```
....
```

```
write_unlock_irqrestore(&lock_var, cpu_flags);
```

- For a complete list, have a look at include/linux/spinlock.h.

13. Kernel startup

Explanation for TQM860 PPC board

0. Kernel entry point:

arch/ppc/boot/common/crt0.S:*_start*

1. *_start* calls on:

arch/ppc/boot/simple/head.S:*start*

2. *start* calls on:

arch/ppc/boot/simple/relocate.S:*relocate*

3. *relocate* calls on:

arch/ppc/boot/simple/misc-embedded.c: *load_kernel()*

4. *load_kernel()* initializes the serial line and uncompresses kernel starting at address 0.

6. *relocate* jumps to address 0x00000000, where kernel start address is.
7. arch/ppc/kernel/head_8xx.S: *__start*
8. *__start* eventually calls init/main.c:*start_kernel()*
9. *load_kernel()* returns to *relocate*
10. *start_kernel()* does:
 1. Locks kernel
 2. *setup_arch()*
 3. *sched_init()*
 4. *parse_args()*
 5. *trap_init()*
 6. *init_IRQ()*

7. *time_init()*
8. *console_init()*
9. *mem_init()*
10. *calibrate_delay()* => *loops_per_jiffy*
11. *rest_init()*

11. *rest_init()* does:

1. Start init thread
2. Unlocks the kernel
3. Becomes the idle task

12. The init task:

1. *lock_kernel()*
2. *do_basic_setup()* => call various *init()* fcts
3. *prepare_namespace()* => mount rootfs
4. *free_initmem()*
5. *unlock_kernel()*
6. *execve()* on the init program (*/sbin/init*)

14. Dealing with kernel failure

- Kernel is mature and stable, but can fail
- Kernel failure results in call to `kernel/panic.c:panic()`
- Reboot is as according to `panic=` boot param or default (180s)
- Default panic message goes to console
- Need to have your own panic handler
- Main list of callbacks on panic: `panic_notifier_list`.
- Register using `notifier_chain_register()`

```
#include <linux/kernel.h>
#include <linux/init.h>
#include <linux/notifier.h>

static int on_screen_panic_event(struct notifier_block *,
                                 unsigned long,
                                 void *);

static struct notifier_block on_screen_panic_block = {
    notifier_call:    on_screen_panic_event,
    next:             NULL,
    priority:         INT_MAX
};

int __init register_on_screen_panic(void)
{
    printk("Registering on-screen panic notifier \n");

    notifier_chain_register(&panic_notifier_list,
                           &on_screen_panic_block);

    return 0;
}
```

```
void write_raw_user_screen(void)
{
    ...
}

static int on_screen_panic_event(struct notifier_block *this,
                                unsigned long event,
                                void *ptr)
{
    write_raw_user_screen(    );
    return NOTIFY_DONE;
}

__initcall(register_on_screen_panic);
```

Device driver overview

- 1.Licensing reminder
- 2.Device driver model
- 3.Writing a char device driver
- 4.Writing a block device driver
- 5.Writing a network device driver
- 6.Writing an MTD map file
- 7.Writing a framebuffer driver
- 8.Time-keeping
- 9.Memory needs

10. Hardware access

11. Interrupt handling

12. Printing out messages to console

1. Licensing reminder

- Although the use of binary-only modules is widespread, Kernel modules are not immune to kernel GPL.
- Many kernel developers have come out rather strongly against binary-only modules.
- If you are linking a driver as built-in, then you are most certainly forbidden from distributing the resulting kernel under any license other than the GPL.
- If you're wary of the GPL, push critical driver-intelligence to user-space.

2. Device driver model

- Device files
 - Everything is a file in Unix, including devices
 - All devices are located in the /dev directory
 - Only networking devices do not have /dev nodes
 - Every device is identified by major / minor number
 - Can be allocated statically (devices.txt)
 - Can be allocated dynamically
 - To see devices present: `$ cat /proc/devices`
 - Alternatives: devfs, sysfs (used to be driverfs)

- Char devices:
 - Stream-oriented devices
 - Manipulated using: *struct file_operations**
- Block devices:
 - Disk-oriented devices
 - Manipulated using: *struct block_device_operations**
- Networking devices
 - All networking devices
 - Manipulated using: *struct net_device**

- Subsystem drivers:

- USB:

- struct usb_driver **

- MTD:

- Chip driver: *struct mtd_chip_driver **

- Device: *struct mtd_info **

- Framebuffer:

- struct fb_info **

3. Writing a char device driver

- Register char dev during module initialization
- Char dev registration: include/linux/fs.h

```
int register_chrdev(unsigned int,  
                    const char *,  
                    struct file_operations *);
```

- First param: Major number
- Second param: Device name (as displayed in /proc/devices)
- Third param: File-ops
 - Defined in include/linux/fs.h
 - Contains callbacks for all possible operations on a char device.

```

struct file_operations {
    struct module *owner;
    loff_t (*llseek) (struct file *, loff_t, int);
    ssize_t (*read) (struct file *, char __user *, size_t, loff_t *);
    ssize_t (*aio_read) (struct kiocb *, char __user *, size_t, loff_t );
    ssize_t (*write) (struct file *, const char __user *, size_t, loff_t *);
    ssize_t (*aio_write) (struct kiocb *, const char __user *, size_t, loff_t );
    int (*readdir) (struct file *, void *, filldir_t);
    unsigned int (*poll) (struct file *, struct poll_table_struct *);
    int (*ioctl) (struct inode *, struct file *, unsigned int, unsigned long);
    long (*unlocked_ioctl) (struct file *, unsigned int, unsigned long);
    long (*compat_ioctl) (struct file *, unsigned int, unsigned long);
    int (*mmap) (struct file *, struct vm_area_struct *);
    int (*open) (struct inode *, struct file *);
    int (*flush) (struct file *);
    int (*release) (struct inode *, struct file *);
    int (*fsync) (struct file *, struct dentry *, int datasync);
    int (*aio_fsync) (struct kiocb *, int datasync);
    int (*fasync) (int, struct file *, int);
    int (*lock) (struct file *, int, struct file_lock *);
    ssize_t (*readv) (struct file *, const struct iovec *, unsigned long, loff_t *);
    ssize_t (*writev) (struct file *, const struct iovec *, unsigned long, loff_t *);
    ssize_t (*sendfile) (struct file *, loff_t *, size_t, read_actor_t, void *);
    ssize_t (*sendpage) (struct file *, struct page *, int, size_t, loff_t *, int);
    unsigned long (*get_unmapped_area)(struct file *, unsigned long, unsigned ...
    int (*check_flags)(int);
    int (*dir_notify)(struct file *filp, unsigned long arg);
    int (*flock) (struct file *, int, struct file_lock *);
};

```

- Call *register_chrdev()* and pass it a valid *file_operations* structure.
- Return 0 from initialization function to tell insmod that everything is OK.
- That's it. Every time the device in /dev having the same major number as the one you registered is opened, your driver will be called.
- To remove char dev on rmmod:

```
int unregister_chrdev(unsigned int,  
                      const char *);
```

4. Writing a block device driver

- Register block dev during module initialization
- Block dev registration: include/linux/fs.h

```
int register_blkdev(unsigned int,  
                    const char *);
```

- First param: Major number
- Second param: Device name
- Disk allocation: include/linux/genhd.h

```
struct gendisk *alloc_disk(int minors);
```

- Block queue registration: include/linux/blkdev.h

```
extern void blk_init_queue(request_fn_proc *,  
                           spinlock_t *);
```

- Queue of pending I/O operations for device

- First param: Queue handler function
- Second param: Lock for accessing queue
- Call *register_blkdev()*.
- Call *alloc_disk()* and pass it the number of disks.
- Call *blk_init_queue()* and pass it a valid callback.
- Return 0 from init function to tell insmod status

- Now, all block operations on your device (`/dev` entry with same major number as driver) will be queued to your driver.
- To remove block dev on `rmmmod`:

```
void blk_cleanup_queue(request_queue_t * );
void put_disk(struct gendisk *disk);
int unregister_blkdev(unsigned int, const char *);
```

5. Writing a network device driver

- Register net dev during module initialization
- Net dev registration: include/linux/netdevice.h

```
int register_netdevice(struct net_device *dev);
```

- Param: net device ops
 - Defined in include/linux/netdevice.h
 - Contains all callbacks related to network devices
 - This is a huge structure with A LOT of fields
- Call *register_netdevice()* and pass it a valid *net_device* structure.
- Return 0 as status to insmod

- Your device will need to be *opened* by the kernel in response to an *ifconfig* command.
- Your *open()* function must allocate a packet queue to deal with packets sent to your device.
- Calling your device will depend on packet routing at the upper layers of the stack.
- To remove: `unregister_netdev(struct net_device *dev);`

6. Writing an MTD map file

- Must find device in memory and then register it
- Finding a device in memory:
include/linux/mtd/map.h

```
struct mtd_info *do_map_probe(char *name,  
                           struct map_info *map);
```

- First param: Type of probe (ex: “cfi_probe”)
- Second param: map-info
 - Defined in include/linux/mtd/map.h
 - Information regarding size and buswidth
 - Functions for accessing chip

```

struct map_info {
    char *name;
    unsigned long size;
    unsigned long phys;
#define NO_XIP (-1UL)

    void __iomem *virt;
    void *cached;

    int bankwidth;
#ifndef CONFIG_MTD_COMPLEX_MAPPINGS
    map_word (*read)(struct map_info *, unsigned long);
    void (*copy_from)(struct map_info *, void *, unsigned long, ssize_t);

    void (*write)(struct map_info *, const map_word, unsigned long);
    void (*copy_to)(struct map_info *, unsigned long, const void *, ssize_t);
#endif
    void (*INVAL_CACHE)(struct map_info *, unsigned long, ssize_t);

    /* set_vpp() must handle being reentered -- enable, enable, disable
       must leave it enabled. */
    void (*set_vpp)(struct map_info *, int);

    unsigned long map_priv_1;
    unsigned long map_priv_2;
    void *fldrv_priv;
    struct mtd_chip_driver *fldrv;
};

```

- Once located, use *add_mtd_partitions()* to provide partition information to MTD subsystem.

- *add_mtd_partition()* is in
include/linux/mtd/partitions.h

```
int add_mtd_partitions(struct mtd_info *,
                      struct mtd_partition *,
                      int);
```

- First param: pointer returned by *do_map_probe()*
- Second param: partition information as we saw earlier.
- Third param: number of partitions

7. Writing a framebuffer driver

- Register framebuffer during module init
- Framebuffer registration: include/linux/fb.h

```
int register_framebuffer(struct fb_info *fb_info);
```

- Param: fb-info
 - Defined in include/linux/fb.h
 - Contains callbacks for all framebuffer operations

```

struct fb_info {
    int node;
    int flags;
    struct fb_var_screeninfo var; /* Current var */
    struct fb_fix_screeninfo fix; /* Current fix */
    struct fb_monspecs monspecs; /* Current Monitor specs */
    struct work_struct queue; /* Framebuffer event queue */
    struct fb_pixmap pixmap; /* Image hardware mapper */
    struct fb_pixmap sprite; /* Cursor hardware mapper */
    struct fb_cmap cmap; /* Current cmap */
    struct list_head modelist; /* mode list */
    struct fb_ops *fbops;
    struct device *device;
#endif CONFIG_FB_TILEBLITTING
    struct fb_tile_ops *tileops; /* Tile Blitting */
#endif
    char __iomem *screen_base; /* Virtual address */
    unsigned long screen_size; /* Amount of ioremaped VRAM or 0 */
    void *pseudo_palette; /* Fake palette of 16 colors */
#define FBINFO_STATE_RUNNING 0
#define FBINFO_STATE_SUSPENDED 1
    u32 state; /* Hardware state i.e suspend */
    void *fbcon_par; /* fbcon use-only private area */
    /* From here on everything is device dependent */
    void *par;
};

```

- Call *register_framebuffer()* and pass it a valid *fb_info* structure.
- Return 0 from init code
- Access the /dev/fbX (where X is your framebuffer's registration order in relationship to other fb drivers) results in the functions provided in *fb_info* to be called.
- To remove fb dev on rmmod:

```
int unregister_framebuffer(struct fb_info *fb_info);
```

8. Time-keeping

- Simple ways to get the time
 - *jiffies*: updated at every kernel tick
 - *do_gettimeofday()*: good precision depending on arch
 - *get_cycles()*: arch-independent call to get CPU cycle count.
- Being notified in due time:
 - Use timers: include/linux/timer.h
 - *jiffies* resolution
 - Use *struct timer_list*: contains expiry and callback
 - Initialize timer: *init_timer()*
 - Add timer to global timer list: *add_timer()*
 - Remove timer before expiry: *del_timer()*

9. Memory needs

- Main kernel memory functions:
 - *kmalloc(size, type)*: up to 128KB of memory
 - *vmalloc(size)*: get large contiguous virtual memory
- Main types of memory allocation:
 - GFP_KERNEL => normal alloc / may sleep
 - GFP_ATOMIC => int handlers / never sleeps
 - GFP_USER => user-space / low priority
 - ... See include/linux/slab.h for full list

10. Hardware access

- Main functions to be able to access hardware:
 - Checking use of mem region: *check_mem_region()*
 - Requesting region: *request_mem_region()*
 - Releasing region: *release_mem_region()*
 - Map physical region to VM: *ioremap()*

11. Interrupt handling

- Setting up an interrupt handler:

```
extern int request_irq(unsigned int,  
                      irq_handler_t, unsigned long, const char *, void *);
```

- First param: IRQ number
- Second param: handler
- Third param: flags for OS int delivery
- Four param: device name
- Fifth param: provide device ID in case of shared interrupts.
- Disabling interrupt handler:

```
void free_irq(unsigned int, void *);
```

12. Printing out messages to console

- Meet the kernel's printf: *printk()*
- Defined: include/linux/kernel.h

```
int printk(const char * fmt, ...)
```

- Implemented: kernel/printk.c
- Can loose data in cases of large output
- Widely-used throughout kernel sources
- Don't call while holding lock, has lock contention of its own.

A Quick Java Introduction

1. Parts
2. Hello World
3. What's missing from C/C++?
4. What's different?

1. Parts

- JDK
 - Compiler
 - Libraries
- JRE
 - JVM
- Eclipse

2. Hello World

- The code:

```
class HelloWorld {  
    public static void main(String[] args) {  
        System.out.println("Hello World!");  
    }  
}
```

- Compiling:

```
$ javac HelloWorld.java
```

- Running:

```
$ java HelloWorld  
Hello World!  
$
```

3. What's missing from C/C++?

- Preprocessor:
 - #include
 - #define
 - #ifdef/#endif
- Definitions:
 - typedef
 - struct
 - union
 - enum

- Keywords:
 - goto
- Pointers:
 - malloc/free
- Strings as arrays of char:
 - Use “foo”.toCharArray() to get a char array
 - Use foo = new String(charArray) to get a String

4. What's different?

- Garbage collection:

```
String myStr = new String("foo");
myStr = null;
myStr = new String("bar");
```

- String concatenation:

```
strC = strA + strB;
```

- Reflection:

```
// Direct call
new MyClass().foo();
```

```
// Call through reflection reflection
Class cls = Class.forName("MyClass");
cls.getMethod("foo", null).invoke(cls.newInstance(), null);
```

- Interfaces:

```
interface Foo
{
    bar();
}

public class MyClass implements Foo {
    public bar() {
        ...
    }
}
```

- Can implement multiple interfaces (v. multiple inheritance)
- All methods declared as part of a class – no standalone “functions”

- Anonymous classes:

```
public class MyClass {  
    public static void main(String args[]) {  
        new Thread(new Runnable() {  
            @Override  
            public void run() {  
                System.out.println("Hello Anon");  
            }  
        }).start();  
    } // end main  
}
```

- Inheritance:

```
public class Foo extends Bar {  
    ...  
}
```

- Package (first line in source file):

```
package com.foo.mypackage;
```

- Importing (using a package):

```
import com.foo.mypackage;
```

- **Threads:**

```
public class MyThread extends Thread {  
    public void run() {  
        System.out.println("Hello Thread World!");  
    }  
  
    public static void main(String args[ ]) {  
        (new MyThread()).start();  
    }  
}
```

- **Synchronization:**

```
public synchronized void foo( ) {  
    ...  
}
```

- Checking type:

```
public class Foo extends Bar {  
    ...  
}  
...  
foo myFoo = new Foo()  
if (myFoo instanceof Bar) {  
    ...  
}
```

- Overrides:

```
public class Bar {  
    public void aMethod() {  
        ...  
    }  
}  
  
public class Foo extends Bar {  
    @Override  
    public void aMethod() {  
        ...  
    }  
}
```

- **Arrays:**

```
int[ ] myArray = new int[100];
```

- JavaDoc
- Junit
- JNI

- Packages:
